CERT® Resilience Management Model

Cyber Security & Business Resilience

[CERT-RMM: How to make our **business resilient** with the new technologies & dependencies?]

PLOVDIV UNIVERSITY "PAISII HILENDARSKI" FACULTY OF MATHEMATICS AND INFORMATICS

ФМИ, ПУ – 4 курс, СИ

Dr. George Sharkov Dr. Maya Stoeva Christina Todorova gesha@esicenter.bg (ESI CEE), gsharkov@uni-plovdiv.bg mstoeva@uni-plovdiv.bg tina@esicenter.bg (ESI CEE CyResLab)

http://SEMP.esicenter.bg

SEMP: SOFTWARE **E**NGINEERING **M**ANAGEMENT **P**ROGRAM

The course is developed (and compiled) jointly by ESI Center (Eastern Europe) and CMU from the main lines and materials for SEMP, in partnership with SEI/CMU.

It introduces students to process improvement as a main factor for the quality of products and services.

Based on process-oriented models - CMMI, the "industrial" standard developed by SEI/CMU, project management (PMI/PM BOK), personal/team management (PSP/TSP BOK), strategic planning (Balanced ScoreCards), information security.

Augmented by modern methods and techniques – Agile CMMI, Six Sigma, etc. Mapping between main industrial models and standards. Implementation. Models for quality improvement in small settings and SMEs. Business aspects – cost of quality, what is "the right model for my company", why invest in PI, what is the return, who can help.

Sample definition of IA:

Measures that protect and defend information and information systems by ensuring their availability, integrity authentication, confidentiality and non-repudiation. These measures include providing for restoration of information systems by incorporating protection, detection, and reaction capabilities.

Sample definition of IA:

How are you going to cover all of these in three days? Information assurance is related to the field of information security, in that it is primarily concerned with the protection of information systems and their contents. Generally considered the more broadly-focused of these two fields, IA consists more of the strategic risk management of information systems rather than the creation and application of security controls. In addition to defending against malicious hackers and code (e.g., viruses), IA practitioners consider corporate governance ssues such as privacy, regulatory and standards compliance, auditing, business continuity, and disaster recovery as they relate to information systems. Further, while information security draws primarily from computer science, IA is an interdisciplinary field requiring expertise in accounting, fraud examination, forensic science, management science, systems engineering, security engineering, and criminology, in addition to

WICHITA, Kan.—A key <u>Boeing</u> Co. <u>BA +2.51%</u> supplier said it aims to resume some deliveries by the end of the week after tornadoes battered its factories here, highlighting the fragility and resilience of the aerospace giant's global supply chain a it works to sharply increase production.

The storms late Saturday caused significant-to-major damage to 10 buildings at the flagship campus of Spirit AeroSystems Inc., which makes fuselages and other parts for Boeing's hot-selling 737, 777 and 787 Dreamliner passenger jets. Spirit executive said production—which normally runs seven days a week—would be suspended "at least" through Tuesday, and that it expects "near-term production disruptions, including delivery impacts" to customers.

Spirit spokesman Ken Evans said initia assessments found most of its machinery and inventory intact. "We believe we can use the facilities we've got," he said in an interview here in Wichita, a major manufacturing hub for the aerospace industry. "We den't

The Harvard Brain Tissue Resource Center at McLean Hospital in Belmont, Mass., said Monday it is investigating what caused the temperature in a freezer to rise without sounding two backup alarm systems.

The freezer had stored 150 brain specimens, including 53 earmarked for research into causes and treatments of autism, a condition characterized by poor social skills and difficulties with communication.

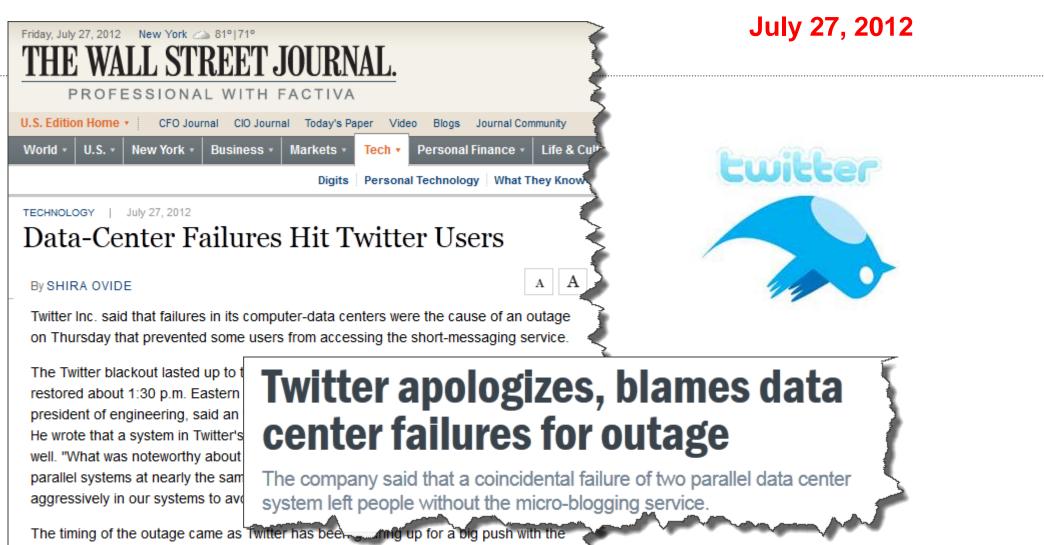

The brain specimens are part of a collection of 168 brains belonging to Autism Speaks

India electricity grids fail leaves 620 million people without power

Thomson Reuters Corp. said Friday that its blogging platform for Reuters News was hacked, resulting in multiple false posts to its website, including a fake interview with a Syrian rebel army leader.

"Reuters did not carry out such an interview and the posting has been deleted," the international news service posted Friday on Twitter.

Reuters didn't release any details about who was responsible for the attack. "We are working to address the problem," a spokeswoman said in a statement.

According to Reuters, a false blog post attributed to one of its reporters, contained an interview with the Free Syrian Army leader Riad al-Asaad, saying that his forces were going to retreat from Aleppo, a northern Syrian province, after encountering the Syrian army. For months, the Free Syrian Army has been fighting the Syrian government for control of the country.

Reuters said the Free Syrian Army released a statement saying that the interview never took place and blamed Syrian President Bashar al-Assad's government for the false

The wediat

(Reuters) - Reuters News said one of its Twitter accounts was hacked on Sunday and false tweets were posted, mainly related to the current armed struggle in Syria.

"Earlier today @ReutersTech was hacked and changed to @ReutersME," said a spokesperson for Reuters, which is owned by Thomson Reuters CorpTO>. "The account has been suspended and is currently under investigation."

The incident follows the company's disclosure that the blogging platform of the Reuters News website was compromised on Friday and a false posting purporting to carry an interview with a Syrian rebel leader was illegally posted on a Reuters' journalist's blog.

In the latest incident a series of 22 false tweets were sent purporting to be from Reuters News. Some of the tweets also carried false reports about Syrian rebel losses suffered in battles with Syrian government forces.

U.S. Power Plant Hit by USB-Based Malware

January 16, 2013 03:14pm EST

21 Comments

A U.S.-based power plant was hit with a malware attack thanks to an infected USB stick used for software updates.

The incident was revealed in a **new report** from th U.S. Industrial Control Systems Cyber Emergency Response Team (ICS-CERT). The power plant contacted CERT after discovering a virus in a turbine control system that impacted about 10 computers on its control system network, and affected operations for about three weeks.

The USB drive in question was used to back up control system configurations. However, when th

technician - who was not aware of the malware - inserted the USB stick into a computer with antivirus software, it picked up on at least three incidents of malware.

"Initial analysis caused particular concern when one sample was linked to known sophisticated malware," according to CERT, which deployed a team in October for an onsite inspection.

That team found the malware on two engineering workstations that were "critical to the operation of the control environment." Compounding the problem was the fact that there

3. Building Resilience toLarge- ScaleCyberattacks

Building Resilience to Large-Scale Cyberattacks

Background

As the Fourth Industrial Revolution as, the pace of technological to also brings with it new abilities (see the Global Fisics or construction), these vulnerabilities are d with increasing global digital c cyber systems and the data they hold Internet, automation of knowledge work, the Internet of Things and cloud technology will be the most disruptive".⁵⁵ While this innovation will result in new efficiencies and capabilities, it will also introduce new vulnerabilities, allowing attackers to quickly evolve their tactics and exploit unaddressed system and network weaknesses.

Further compounding the risk is today's hyperconnected global environment, where people and things, critical infrastructures and economies are increasingly digitally connected anytime and anywhere. According to this year's Global Risks Report 2016, "As the Internet of Things leads to more connections between people and machines, cyber dependency due to increasing digital interconnection of people, things and organizations considered by survey respondents as the third most important global trend will increase."91 This hyperconnectivity ties the risk of one entity to all entities with which it shares a connection, thereby multiplying the ways through which an attacker could gain access to systems and data. Similarly, it increases the potential for cascading consequences resulting from a cyberattack or cyber disruption.

Although many entities are poised to reap the benefits of technological and capabilities for readiness, respo. reconstitution and reinvention. Building resilience to large-scale cyberattacks requires a concerted effort towards advancing the understanding of and the disciplines that contribute to cyber resilience. This section posits a number of suggestions on how to improve the cyber resilience of organizations. Some require action by governments and some can be taken by all entities – public or private/big or small.

Recommendations

A. Increase Understanding of Risk of Large-Scale Cyberattacks and other Cyber Threats

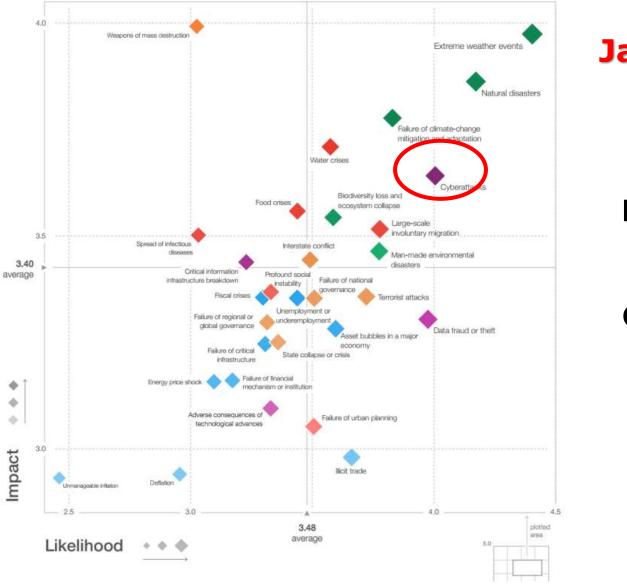

As described above, it is clear that the dramatic pace of technological innovation today, coupled with widespread global connectivity and vast amounts of data creation, have resulted in increasing risk to cyber assets and online networks. The risk of large-scale cyberattacks continues to feature as a high impact/high likelihood risk in the Global Risks Landscape 2016 (Figure 1) - although overshadowed by environmental and societal risks. However, it is worth noting that the overall perception of the significance of larga-scale cyberattacks and a closely connected risk the breakdown of

The hacking tool, called 'Eternal Blue', gives unprecedented access to all computers using Microsoft Windows, the world's most popular computer operating system. It had been developed by the NSA to gain access to computers used by terrorists and enemy states.

The gang in turn 'dumped' the computer bug on an obscure website on April 14 and it is believed to have been picked up by a separate crime gang which has used it to gain remote access to computers around the world.

The hackers, who have not come forward to claim responsibility or

ing tools widely believed to have been developed by the US Nationa

Russian military was behind 'NotPetya' cyberattack in Ukraine, CIA concludes

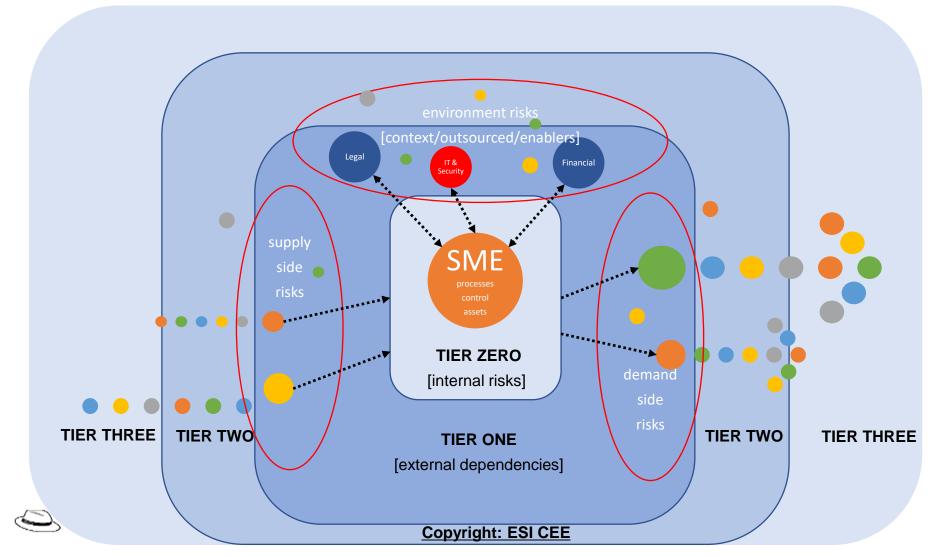

June 27, 2017

NotPetya

NotPetya is malware that was first seen in a worldwide attack starting on June 27, 2017. The main purpose of the malware appeared to be to effectively destroy data and disk structures on compromised systems. Though NotPetya presents itself as a form of ransomware, it appears likely that the attackers never intended to make the encrypted data recoverable. As such, NotPetya may be more appropriately thought of as a form of wiper malware. NotPetya contains worm-like features to spread itself across a computer network using the SMBv1 exploits EternalBlue and EternalRomance.^{[1][1][2][3]}

Solution: Implementation schemes & engagement Supply/value chains as Blockchains

Example > NotPetya spread over Supply Chains and affected other countries !!!

"Petya Is Not A Ransomware"
1) TRUST = Need
standards applicable

and affordable for ALL players (SMEs!!)

but also

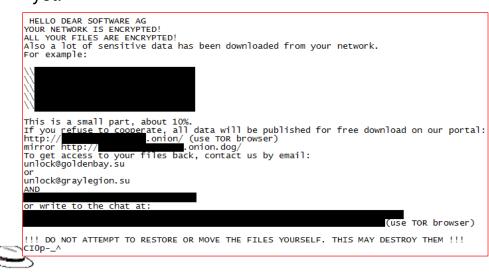

2) Provide a **natural engagement** and propagation mechanism (shared risk requires shared responsibility)

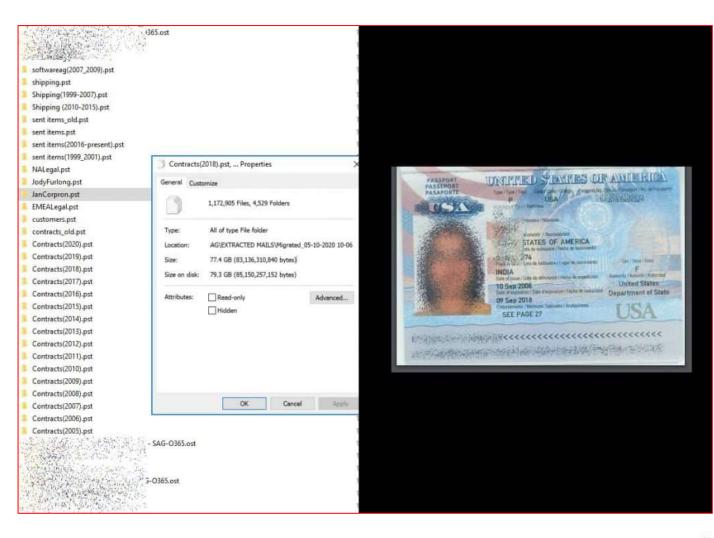

3 October 2020 (covid-19 pandemic) Clop ransomware hits Software AG, demands \$20 million+ ransom

Software AG, a German tech giant had its helpdesk and internal communication systems disrupted after the Clop ransomware attack.

Over the weekend, Germany's second-largest tech firm Software AG suffered a ransomware attack. The company had to shut down many of its internal systems. Allegedly, the attackers took company data and demanded over \$20 million (€17 million) in ransom.

According to the company, its cloud offerings weren't affected; however, its internal communications and helpdesk went offline and haven't recovered fully as vet.

Ransomware gang publishes stolen data after Scottish Environment Protection Agency (SEPA) refuses to pay ransom - as agency confirms operations remain disrupted.

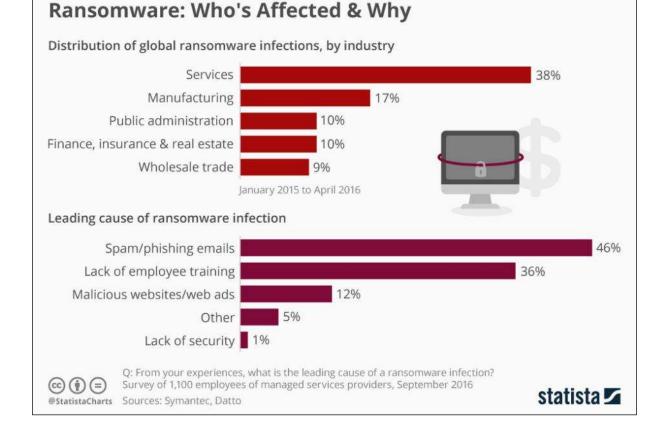

> By Danny Palmer | January 22, 2021 -- 11:32 GMT (11:32 GMT) | Topic: Security

The hackers behind the <u>ransomware</u> attack on the Scottish Environment Protection Agency (SEPA) have published thousands of stolen files after the organisation refused to pay the ransom.

Scotland's government regulator for protecting the environment was <u>hit with</u> <u>a ransomware attack on Christmas Eve</u>, with cybercriminals stealing 1.2 GB of data in the process. Almost a month on from the attack, SEPA services remain disrupted – but despite this, the agency has made it clear it won't engage with those behind the attack.

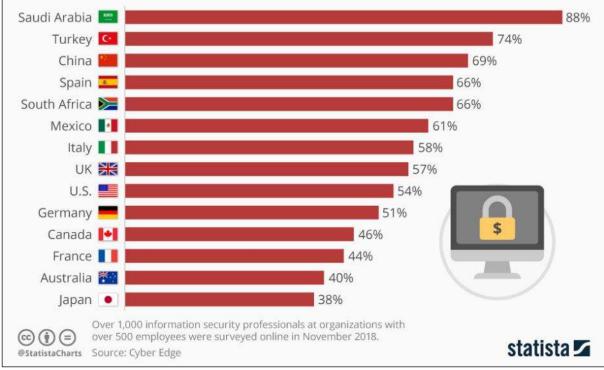

SEPA hasn't confirmed what form of ransomware it has fallen victim to, but the <u>Conti ransomware gang</u> claimed responsibility for the attack.

As a **result of the non-payment**, Conti has published all of the stolen data on its website, posting over 4,000 documents and databases related to contracts, commercial services and strategy. The <u>latest update from</u> <u>SEPA</u> confirms that at least 4,000 files have been stolen and published.

Google: Here's what caused our big global outage

Google fingers its storage quota system for the outage affecting Gmail, YouTube and Google Cloud Platform.

🕨 in 🖬 f У 🖬 🐥

By Liam Tung | December 15, 2020 - 11:08 GMT (11:08 GMT) | Topic: Cloud

14 December 2020

https://www.zdnet.com/article/google-heres-what-caused-our-big-global-outage/

The company reveals that the crux of the issue, now tagged as 'Google Cloud Infrastructure Components incident 20013', was reduced capacity for Google's central identity-management system, blocking any service that required users to log in.

However, the root cause was an issue in Google's automated storage quota management system, which in turn reduced the capacity of the authentication system.

The two main services impacted were Google Cloud Platform, which means Cloud Console, Cloud Storage, BigQuery, and the Google Kubernetes Engine. All users would have experienced an authentication error during the 50-minute outage.

Google Workspace, formerly G Suite, services affected included Gmail, Calendar, Meet, Docs and Drive. Again, all users globally were experiencing authentication errors.

It's the third worldwide outage at a public cloud provider in the past two months. Google's service disruption wasn't as long as the fivehour Amazon Web Services outage last month, but the broad impact of both incidents affected each company's technical support and their engineers' ability to communicate with external customers.

20 November 2020 (covid-19 panemic) A reporter hacked an EU Council meeting

In Friday's incident, a member of Dutch Defense Minister Ank Bijleveld's staff <u>tweeted a</u> <u>picture</u> containing the **web address** of the meeting. The URL **displayed the meeting ID and five of the six digits** needed to access the meeting. Using login information shared on one of the defense ministers' Twitter accounts, the Dutch 31-year-old reporter <u>gatecrashed their meeting on</u> <u>Friday</u>, creating a moment of comic relief — combined with a security alert — at a meeting where a classified document on threats facing the EU was on the agenda.

Why Software Is Eating The World

By MARC ANDREESSEN August 20, 2011

ESSAY

This week, Hewlett-Packard (where I am on the board) announced that it is exploring jettisoning its struggling PC business in favor of investing more heavily in software, where it sees better potential for growth. Meanwhile, Google plans to buy up the cellphone handset maker Motorola Mobility. Both moves surprised the tech world. But both moves are also in line with a trend I've observed, one that makes me optimistic about the future growth of the American and world economies, despite the recent turmoil in the stock market. \equiv

Hacked again? Russian hackers still inside Sony Pictures' network, security firm says

Lucian Constantin

Feb 4, 2015 12:23 PM

Sony Pictures Entertainment (SPE) might have a second security breach on its hands, or maybe the hackers from November's scandalous attack are still inside the company systems, according to a security firm that claims to have seen evidence of Russian hackers having access to SPE internal data.

The hackers accessed SPE's Culver City, California network in late 2014 by sending spear phishing emails to Sony employees in Russia, India and other parts of Asia, U.S. security intelligence firm Taia Global said Wednesday in a report.

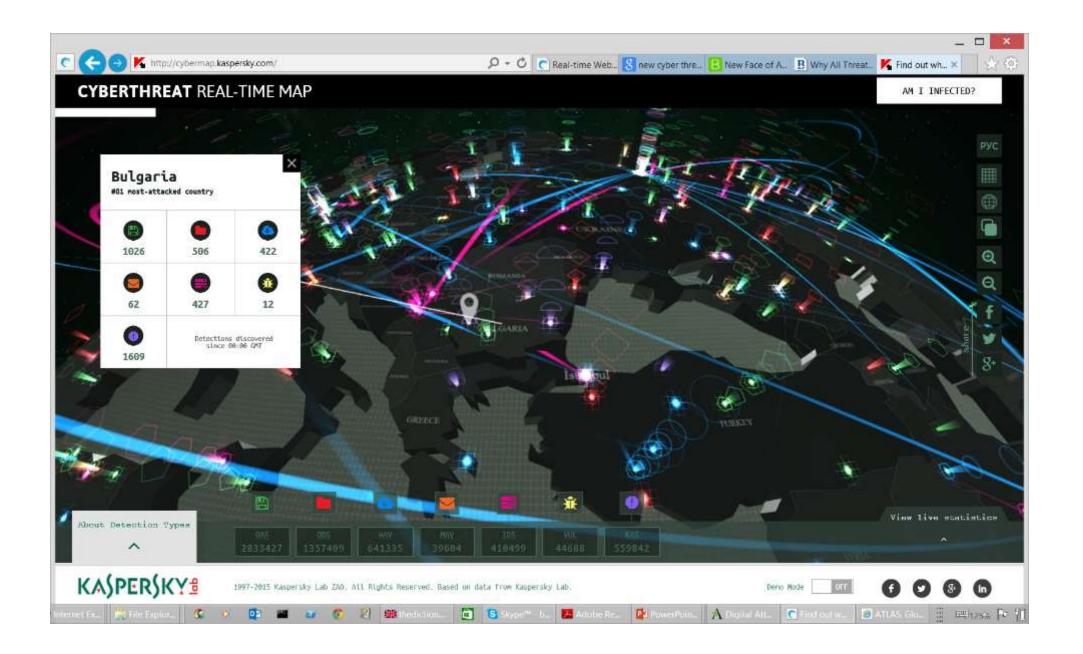

The original Sony Pictures hack was blamed on North Korea, which was apparently upset depiction of country leader Kim Jong-un

The U.S. government blamed the North Korean government for the attack, with bot officials saying they're confident about the attribution. Some security firms and exp including Taia Global, which based on a linguistic analysis of the English statement Guardians of Peace members following the attack concluded that they're most likel speakers.

Now Taia Global, given the evidence it has in its possession, thinks one of these to closer to reality than the assessment from Sony and the U.S. government:

Cybersecurity and resilience: Cyber Domain (Digitized Ecosystem) and Standardization

Digitized Europe fundamentals:

- DSM (Digital Single Market) strategies, programs
- GDPR (General Data Protection Regulation) May 2018
- NISD (Security of Network and Information Systems Directive) May 2018
- EU Cyber Act (Package) ENISA 2.0 Regulation + Cybersecurity Certification June 2019
- EU Cybersecurity Strategy + NIS-d Directive (16 Dec 2020) TBC
- others (like PSD2 for banks/payments)
- All cybersecurity aspects are covered (no significant gaps), BUT:
 - **too many standards**, and many are not actionable or particularly useful (entry barrier for SMEs)
 - **need to converge** toward useful, interoperable sets of standards
 - if not freely available on-line, constantly evolving, and well-versioned low practical value and represent cybersecurity impediments
 - need broad industry & society, public-private support and adoption (multi-stakeholder holistic approach)

There are no simple or easy cyber security solutions

- 100% cybersecurity is not achievable reduced risks (defense, threat exchange measures) and business resilience
- security measures may have privacy concerns (e.g. end-to-end-encryption)
- Rapidly evolving new industry platforms (NFV-SDN/5G, quantum computing...) need urgent "predictive" attention

Kill Chain (unified)

A unified version of the kill chain was developed to overcome common critiques against the traditional cyber kill chain, by uniting and extending Lockheed Martin's kill chain and <u>MITRE</u>'s ATT&CK framework. The unified kill chain is an **ordered arrangement of 18 unique attack phases** that may occur in end-to-end cyber attacks, which covers activities that occur outside and within the defended network. As such, the unified kill chain improves over the scope limitations of the traditional kill chain and the time-agnostic nature of tactics in MITRE's ATT&CK. The unified model can be used to analyze, compare and defend against end-to-end cyber attacks by advanced persistent threats (APTs).

Map · Gallery · Understanding DDoS · FAQ · About · 🔠 💟 f

Attack Class: Four common categories of attacks

TCP Connection Attacks - *Occupying connections*

These attempt to use up all the available connections to infrastructure devices such as load-balancers, firewalls and application servers. Even devices capable of maintaining state on millions of connections can be taken down by these attacks. Learn more...

Volumetric Attacks - Using up bandwidth

These attempt to consume the bandwidth either within the target network/service, or between the target network/service and the rest of the Internet. These attacks are simply about causing congestion. Learn more...

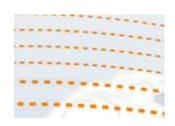

Fragmentation Attacks - Pieces of packets

These send a flood of TCP or UDP fragments to a victim, overwhelming the victim's ability to re-assemble the streams and severely reducing performance. <u>Learn more...</u>

Application Attacks - *Targeting applications*

These attempt to overwhelm a specific aspect of an application or service and can be effective even with very few attacking machines generating a low traffic rate (making them difficult to detect and mitigate). Learn more...

Amplification: Two ways attacks can multiply traffic they can send. https://digitalattackmap.com/understanding-ddos/

DNS Reflection - *Small request, big reply.*

By forging a victim's IP address, an attacker can send small requests to a DNS server and ask it to send the victim a large reply. This allows the attacker to have every request from its botnet amplified as much as 70x in size, making it much easier to overwhelm the target. Learn more...

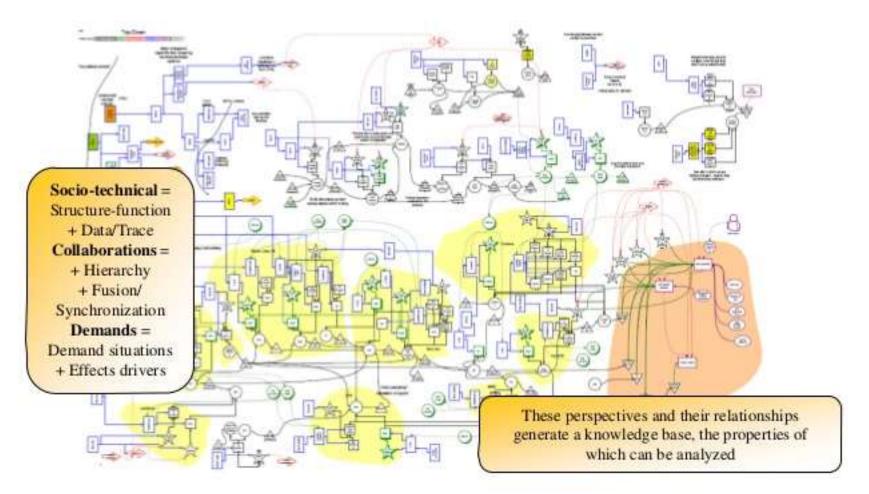

Chargen Reflection - *Steady streams of text* Most computers and internet connected printers support an outdated testing service called Chargen, which allows someone to ask a device to reply with a stream of random characters. Chargen can be used as a means for amplifying attacks similar to DNS attacks above Learn more...

Complex systems of systems:

all three modeling perspectives become necessary

Cyber resilient business, organizations, society

Operational Risk Management

A form of risk affecting day-to-day business operations

A very broad risk category

 From high-frequency low-impact to low-frequency high-impact

Exacerbated by

- Actions of people
- Systems and technology failures
- Failed internal processes
- External events
- Bad decisions

Operational resilience emerges from effective management of operational risk.

Organizational certainties

Risk environment will not contract—number of risks and complexity will increase.

Organizations must get better at "surviving" in uncertainty.

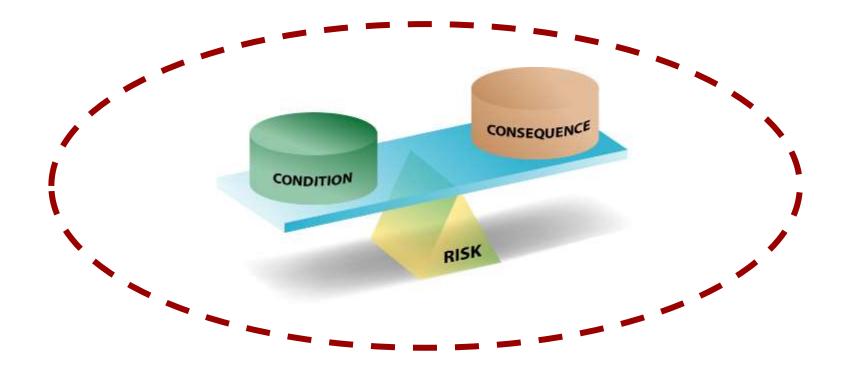

Knowledge and awareness of risk issues must be pervasive throughout the organization.

Traditional tools, techniques, and methods may not work in this environment.

Existing organizational structures may not be agile enough to adapt.

Managing Operational Risk requires a holistic approach

Managing both sides of the risk equation in alignment with business drivers and full knowledge of costs increases the risk management capability of the organization.

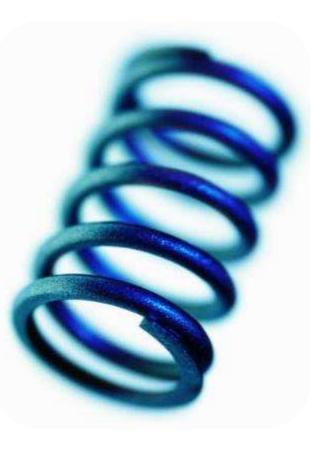

Operational resilience defined

<u>Resilience</u>: The physical property of a material when it can return to its original shape or position after deformation that does not exceed its elastic limit [wordnet.princeton.edu]

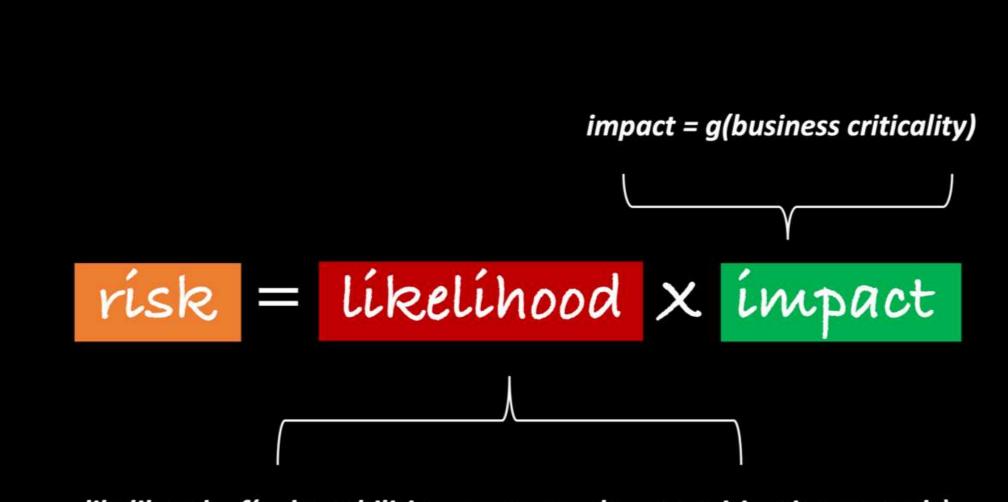

Operational Resilience: The

emergent property of an organization that can continue to carry out its mission in the presence of *operational stress* and *disruption* that does not exceed its operational limit [CERT-RMM]

Where does the *disruption* come from? Realized risk.

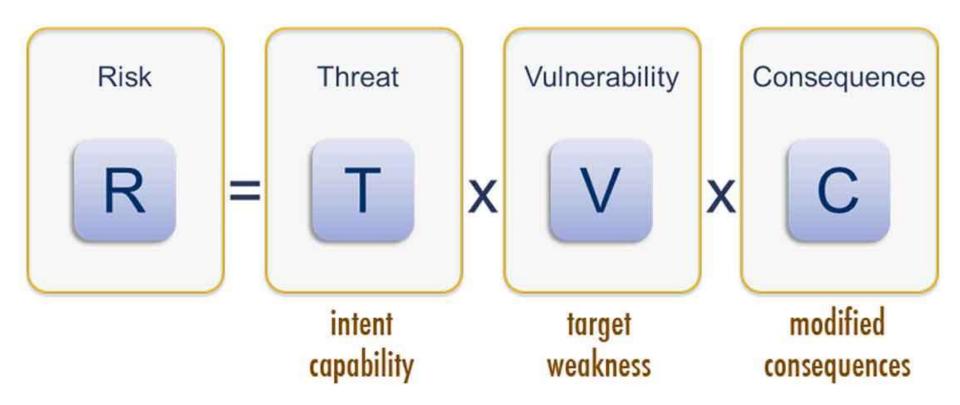

likelihood = f(vulnerabilities, exposure, threats, mitigating controls)

Risk = TVC

Q

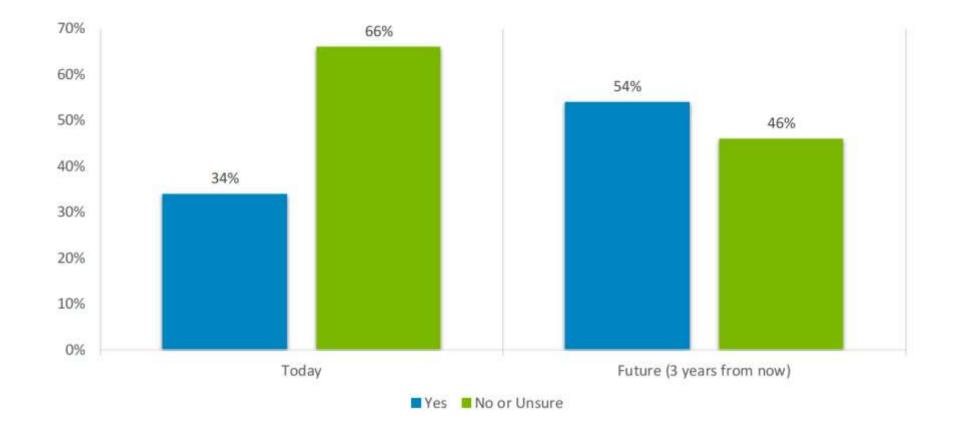

I

"You must not say 'never.' That is a lazy slurring-over of the facts. Actually, [risk analysis] predicts only probabilities. A particular event may be infinitesimally probable, but the probability is always greater than zero."

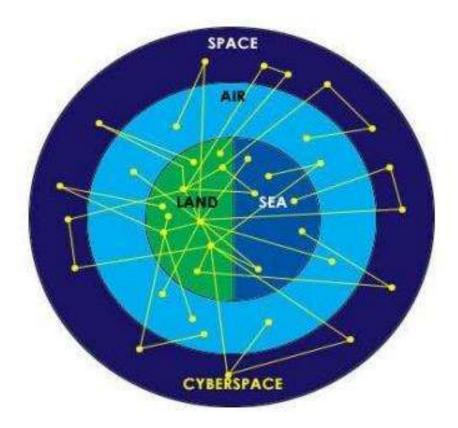

Second Foundation (Isaac Asimov)

Percentage of senior leadership that views cybersecurity as a strategic priority

<u>Cyber Defense: Cyberspace as the 5th Domain</u>: From "defense" to "resilience"

Enterprise Management

Operations Management

Process Management

CERT-RMM Approach

Operational Resilience Management System

What to do

Comprehensive nonprescriptive guidance on what to do to manage operational resilience

Process Dimension

Process Institutionalization and Improvement

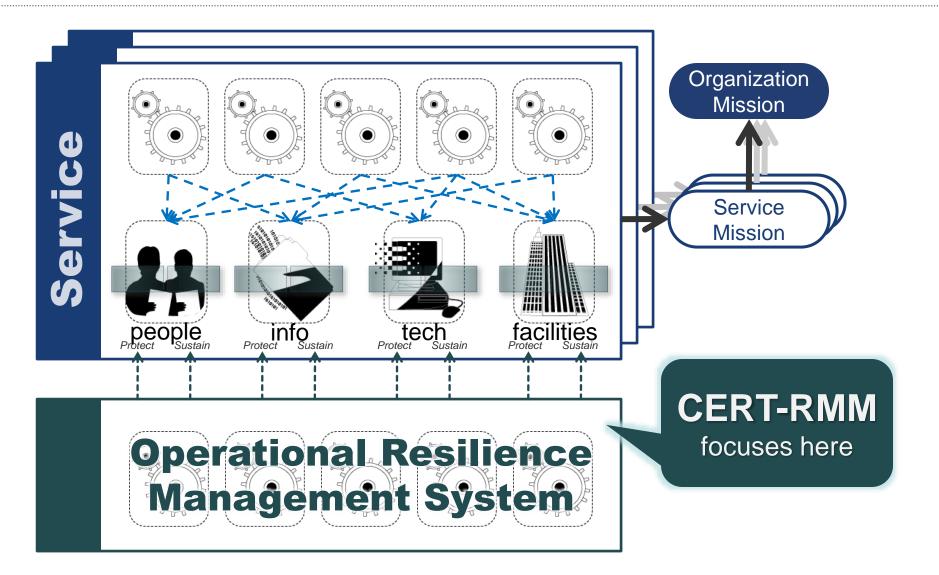

Making it stick

Proven guidance for institutionalizing processes so that they persist over time

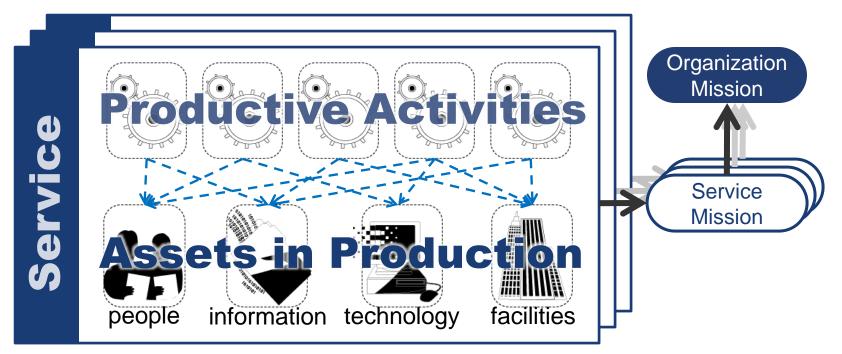

Capability Dimension

Organizational context

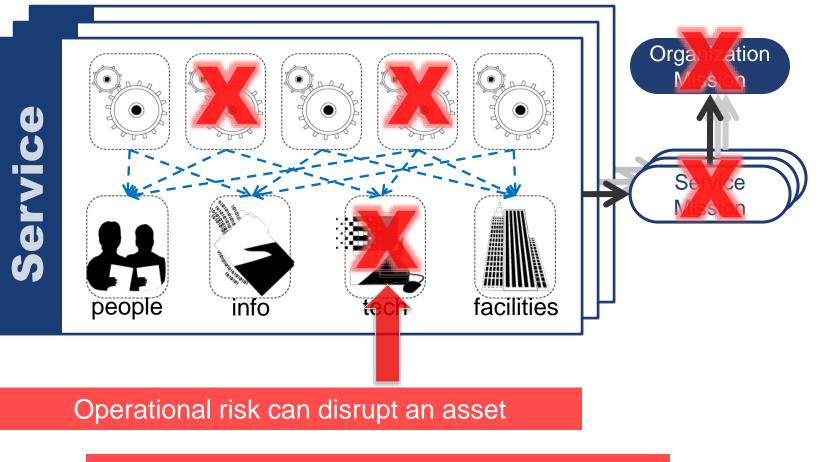

Organizational context

Four asset types:

- **People** the human capital of the organization
- Information data, records, knowledge in physical or digital form
- **Technology** software, systems, hardware, network
- Facilities offices, data centers, labs the physical places

Organizational context - disruption

And lead to organizational disruption

Supply chain resilience: NASDAQ 9/11; fully ready to operate within 24 hours; no trading partners; need to manage your supply chain both upstream and downstream

Supply chain resilience (NASDAQ after 9/11)

People resilience (two banks after 9/11)

Changes in operational environment (USPS

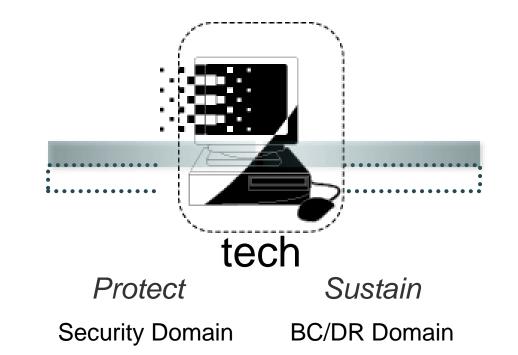

Technology resilience (Egypt internet/cell pr

Prioritizing external relationships (based on

Determining critical assets (networked kiosk

USPIS dealing with white powder; never an issue until 9/11; they have white powder all of the time (coating on magazines etc.); after 9/11 white powder took on a totally different meeting; could close down a postal sorting facility for weeks; hazmat team; analyze white power; eradicate/remediate; then reopen; implemented a **white powder** incident management process in all sorting facilities;

Building resilience at the asset level

Protection strategies

Keep assets from exposure to disruption Typically implemented as "security" activities

Sustainment strategies

Keep assets productive during adversity

Typically implemented as "business continuity" activities

Types of requirements

Confidentiality – Ensuring that only authorized people, processes, or devices have access to an information asset

Integrity – Ensuring that an asset remains in the condition intended and so continues to be useful for the purposes intended

Availability – Ensuring that an asset remains accessible to authorized users (people, processes, or devices) whenever it is needed

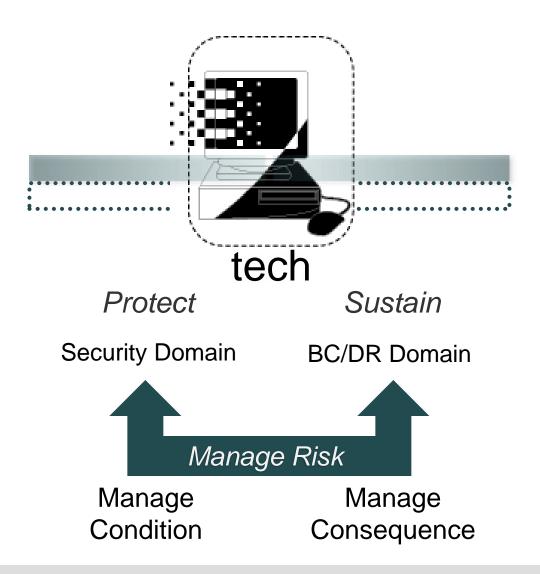

Applicability of requirements

Not all resilience requirement types apply to all asset types.

Resilience	Asset Type			
Requirement	People	Information	Technology	Facilities
Confidentiality		X		
Integrity	X *	X	X	X
Availability	X	X	X	X

Resilience strategy

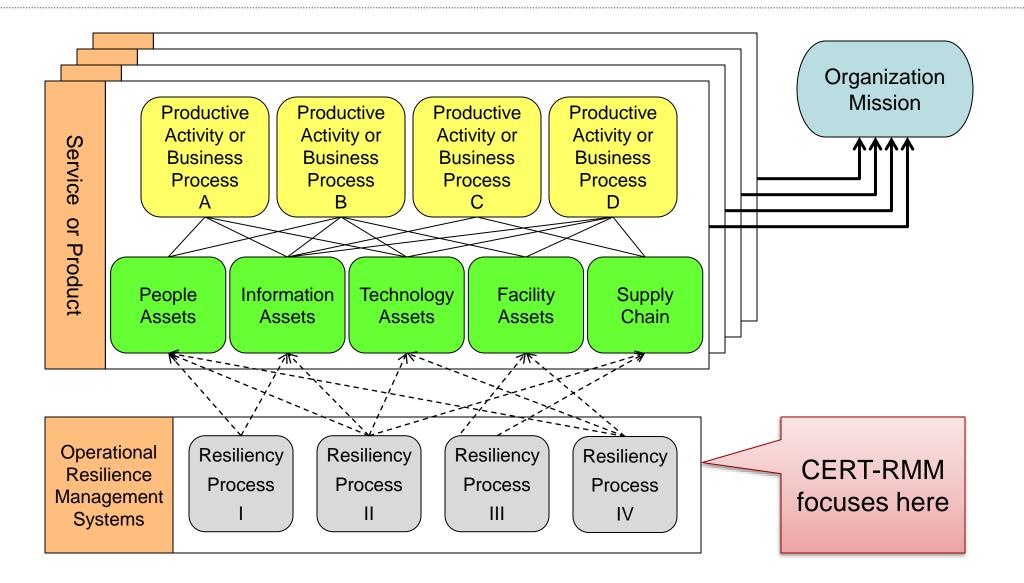

The optimal "mix" of protection and sustainment strategies

Depends on the value of the asset to the service and the cost of deploying and maintaining the strategy

BC, security, & IT operations collaborating to manage risk

Organizational Context for Resiliency Activities

Operations process areas

Managing the operational aspects of resilience

PM – People Management

- **KIM** Knowledge and Information Management

- VAR Vulnerability Analysis and Resolution
- **EXD** External Dependencies Management

Engineering process areas

Establishing resilience for organizational assets and services

- **ADM** Asset Definition and Management
- **RRD** Resilience Requirements Development
- **RRM** Resilience Requirements Management
- **SC** Service Continuity
- **CTRL** Controls Management
- **RTSE** Resilient Technical Solution Engineering

Enterprise management process areas

Supporting the resilience process

- **EF** Enterprise Focus
- **COMP** Compliance
- **FRM** Financial Resource Management
- HRM Human Resource Management
- **RISK** Risk Management
- **COMM** Communications
- **OTA** Organizational Training and Awareness

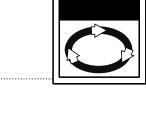

Process management process areas

Defining, planning, deploying, implementing, monitoring, controlling, appraising, measuring, and improving processes

MON – Monitoring

- **MA** Measurement and Analysis
- **OPD** Organizational Process Definition
- **OPF** Organizational Process Focus

A set of practices performed to achieve a given purpose

Utilizes people and technology

Defined at many levels

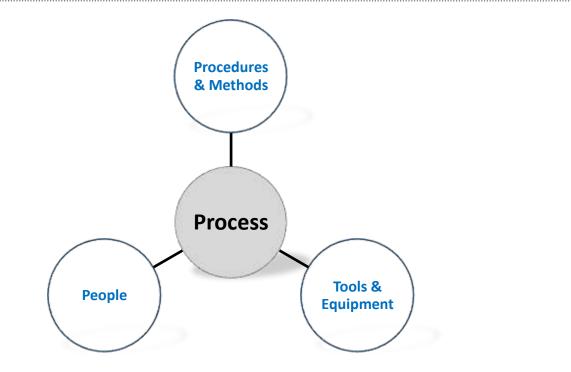

- Higher order "process" such as the "software engineering process" or the "resilience management process"
- Lower order "process" such as the invoicing process or the check cashing process

Regardless of level, all have the same basic attributes—an ordered way to achieve something

The value of process

Organizational improvement requires a focus on three critical dimensions: people, procedures and methods, and tools and equipment.

Process is what unifies these critical dimensions toward organizational objectives.

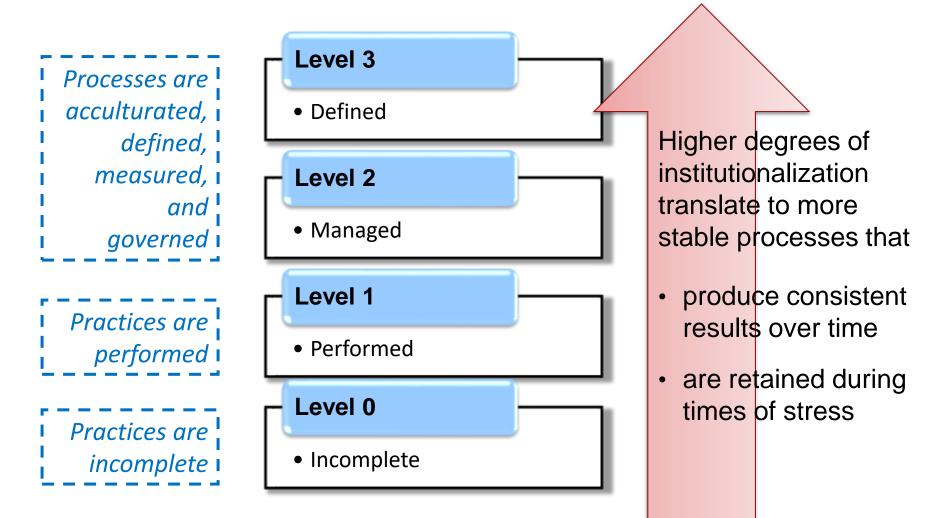

The quality of a system or product is highly influenced by the quality of the process used to acquire, develop, and maintain it. *

RTSE – Resilient Technical Solution Engineering

Purpose:

Ensure that software and systems are developed to satisfy their resilience requirements

Software and systems are pervasive organizational assets that automate services and support business processes to help organizations meet their missions. The importance of resilient technical solutions—software and systems that resist threats, function satisfactorily in the face of adversity, and continue to help services meet their missions during times of stress cannot be overstated.

Resilient software and systems do not become survivable and resistant to threat without an organizational commitment to address resilience throughout the development process.

These assets must be specifically designed and developed with consideration of the types of threats they will face, the operating conditions and changing risk environment in which they will operate, and the priority and sustainment needs of the services they support.

RTSE: Building in versus bolting on

Requires organizational intervention

Extends resilience requirements to assets that are **to be developed**

Creates requirements for quality attributes

Attempts to reduce the level of operational risk

Extends across the life cycle

RTSE:SG1 Establish Guidelines for Resilient Technical Solution Development

Guidelines are developed to ensure proper consideration of resilience activities and controls in all phases of the life cycle

RTSE:SG1.SP1 Identify General Guidelines

RTSE:SG1.SP2 Identify Requirements Guidelines

RTSE:SG1.SP3 Identify Architecture and Design Guidelines

RTSE:SG1.SP4 Identify Implementation Guidelines

RTSE:SG1.SP5 Identify Assembly and Integration Guidelines

RTSE:SG2 Develop Resilient Technical Solution Development Plans

Plans for addressing resilience in the development life cycle are created, based on documented guidelines

RTSE:SG2.SP1 Select and Tailor Guidelines

RTSE:SG2.SP2 Integrate Selected Guidelines with a Defined Software and System Development Process

RTSE:SG3 Execute the Plan

Progress against the plan for developing resilient software and systems is monitored throughout the development life cycle

RTSE:SG3.SP1 Monitor Execution of the Development Plan

RTSE:SG3.SP2 Release Resilient Technical Solutions into Production

Example: RTSE:SG1.SP4 Identify Implementation Guidelines

Typical work products

- 1. Coding guidelines for resilient software
- 2. Testing guidelines for resilient software
- 3. Testing guidelines for resilient systems

Subpractices

- 1. Identify coding guidelines for the development of resilient software.
- risk analysis during coding
- threat analysis during coding
- attack surface evaluation and mitigation
- secure design patterns at the implementation level
- secure coding standards (language-specific)
- code checklists, reviews, inspections, and static and dynamic code analysis, including tools to support these, which can be used to verify

2. Identify testing guidelines for the development of resilient software.

- risk analysis during software testing
- threat analysis during software testing
- attack surface reevaluation and mitigation
- 3. Identify testing guidelines for the development of resilient systems.
- risk analysis during system testing
- threat analysis during system testing
- attack surface reevaluation and mitigation
- at the system level, methods for
 - resilience requirements functional testing
 - o black box testing that focuses on the system's externally visible behavior
 - fuzz testing
 - penetration testing
 - o testing for specific vulnerabilities as well as vulnerability regression testing
 - application of threat and attack models
 - integration testing

Closing gaps & develop good code: Secure Coding Standards [languages + compilers] Generic Model to Manage and Assess the Operational Resilience [Information Security, Security Business Continuity]

Secure coding: top 10 recommendations

- 1. Validate input be suspicious of most external data sources
- 2. Heed compiler warnings compile highest warning level available
- 3. Architect and design for security policies e.g. divide the systems into intercommunicating subsystems, each with an appropriate privilege set
- 4. Keep it simple complex design increase implementation, configuration, and use errors; assurance become dramatically complex
- 5. Default deny base access decisions on permission rather than exclusion
- 6. Adhere to the principle of least privilege
- 7. Sanitize data sent to other systems
- 8. Practice defense in depth multiple defensive strategies: if one layer of defense turns inadequate, another layer can prevent a security flaw
- **9. Use effective quality assurance techniques -** identifying and eliminating vulnerabilities: penetration testing, fuzz testing, source code audits
- **10.Adopt a secure coding standard**
- +
- Define security requirements
- Study, Model and Simulate threats (and attacks) >>> Pen Testing (Red Teaming)

Stop vulnerabilities at the source

https://cwe.mitre.org/about/index.html

About CWE

Overview | Board | Board Discussion Archive | Board Meetings Archive | Glossary | History | Sources | Documents FAQs

Overview - What Is CWE?

Common Weakness Enumeration (CWE[™]) is a community-developed <u>list of common software and hardware</u> <u>weakness types</u> that have security ramifications. "Weaknesses" are flaws, faults, bugs, or other errors in software or hardware implementation, code, design, or architecture that if left unaddressed could result in systems, networks, or hardware being vulnerable to attack. The <u>CWE List</u> and associated classification taxonomy serve as a language that can be used to identify and describe these weaknesses in terms of CWEs.

Targeted at both the development and security practitioner communities, the main goal of CWE is to stop vulnerabilities at the source by educating software and hardware architects, designers, programmers, and acquirers on how to eliminate the most common mistakes before products are delivered. Ultimately, use of CWE helps prevent the kinds of security vulnerabilities that have plagued the software and hardware industries and put enterprises at risk.

CWE helps developers and security practitioners to:

- · Describe and discuss software and hardware weaknesses in a common language.
- Check for weaknesses in existing software and hardware products.
- Evaluate coverage of tools targeting these weaknesses.
- · Leverage a common baseline standard for weakness identification, mitigation, and prevention efforts.
- · Prevent software and hardware vulnerabilities prior to deployment.

CWE refers to the types of software weaknesses, rather than specific instances of vulnerabilities within products or systems. Essentially, **CWE** is a "dictionary" of software vulnerabilities, while **CVE** is a list of known instances of vulnerability **for** specific products or systems.

Examples of Weaknesses

Software

- buffer overflows, format strings, etc.
- structure and validity problems
- common special element manipulations
- channel and path errors
- handler errors
- user interface errors
- pathname traversal and equivalence errors
- authentication errors
- resource management errors
- insufficient verification of data
- code evaluation and injection
- randomness and predictability

Hardware

- core and compute issues typically associated with CPUs, Graphics, Vision, AI, FPGA, and uControllers
- privilege separation and access control issues related to identity and policy, shared resources, locking controls, registers, and other features and mechanisms
- power, clock, and reset concerns related to voltage, electrical current, temperature, clock control, and state saving/restoring

Incident Management and Control (IMC)

Event

Incident

Crisis

Incident Management and Control (IMC)

Summary of Specific Goals and Practices

IMC:SG1 Establish the Incident Management and Control Process

IMC:SG1.SP1 Plan for Incident Management IMC:SG1.SP2 Assign Staff to the Incident Management Plan

IMC:SG2 Detect Events

IMC:SG2.SP1 Detect and Report Events IMC:SG2.SP2 Log and Track Events IMC:SG2.SP3 Collect, Document, and Preserve Event Evidence IMC:SG2.SP4 Analyze and Triage Events

IMC:SG3 Declare Incidents

IMC:SG3.SP1 Define and Maintain Incident Declaration Criteria IMC:SG3.SP2 Analyze Incidents

Incident Management and Control (IMC)

IMC:SG4 Respond to and Recover from Incidents

IMC:SG4.SP1 Escalate Incidents IMC:SG4.SP2 Develop Incident Response IMC:SG4.SP3 Communicate Incidents IMC:SG4.SP4 Close Incidents

IMC:SG5 Establish Incident Learning

IMC:SG5.SP1 Perform Post-Incident Review IMC:SG5.SP2 Integrate with the Problem Management Process IMC:SG5.SP3 Translate Experience to Strategy

Security information and event management (SIEM) is a solution that provides a bird's eye view of an IT infrastructure. It fulfills two main objectives:

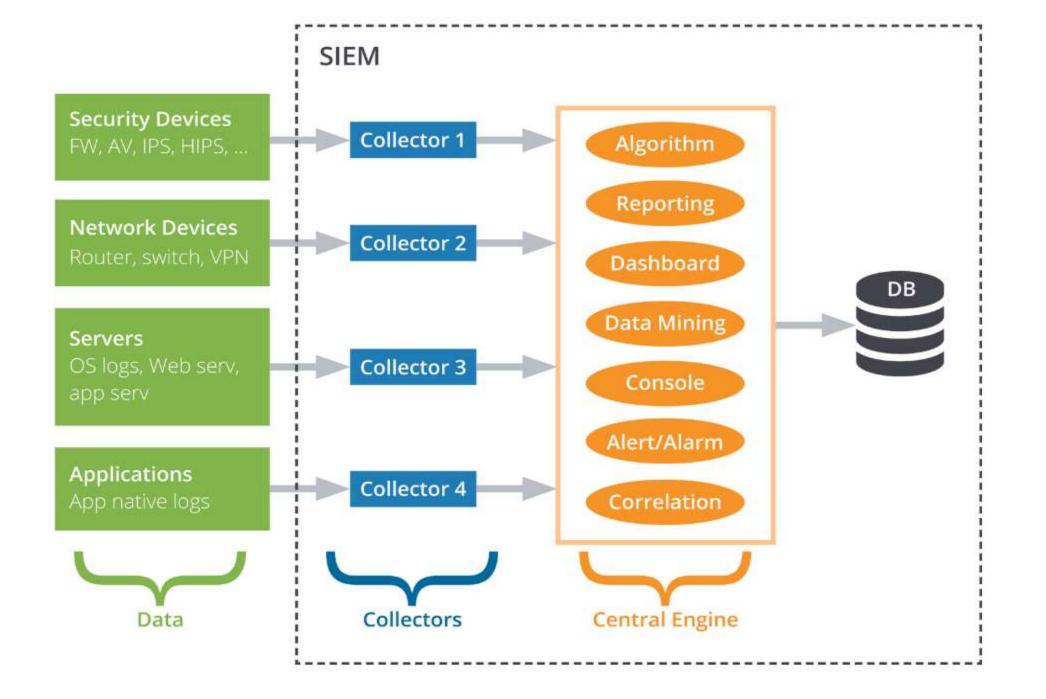

- (1) detecting in (near) real-time security incidents, and
- (2) efficiently managing logs.

These objectives were respectively called **security event management (SEM)** and **security information managemen (SIM)**, but nowadays these functions have been merged into a single capability known as **SIEM**.

From a **high-level point of view, a SIEM** collects information (e.g., logs, events, flows) from various devices on a network, correlates and analyzes the data to detect incidents and abnormal patterns of activity, and, finally, stores the information for later use (reporting, behavior profiling, etc.).

When successfully deployed and configured, a SIEM helps organizations:

- Discover internal/external threats.
- Monitor (privileged) user activity and access to resources.
- Provide compliance reporting.
- Support incident response.

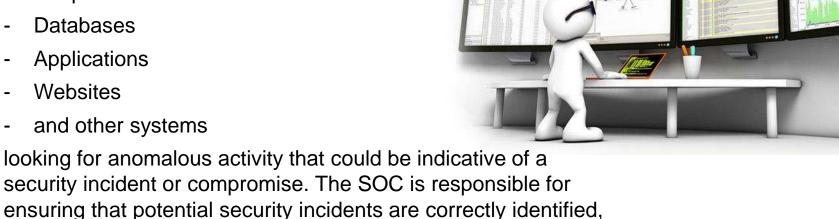

Security Operations Center

A security operations center (SOC) is a facility that houses an information security team responsible for monitoring and analyzing an organization's security posture on an ongoing basis. The SOC team's goal is to detect, analyze, and respond to cybersecurity incidents using a combination of technology solutions and a strong set of processes. Security operations centers are typically staffed with security analysts and engineers as well as managers who oversee security operations. SOC staff work close with organizational incident response teams to ensure security issues are addressed quickly upon discovery.

Security operations centers monitor and analyze activity on:

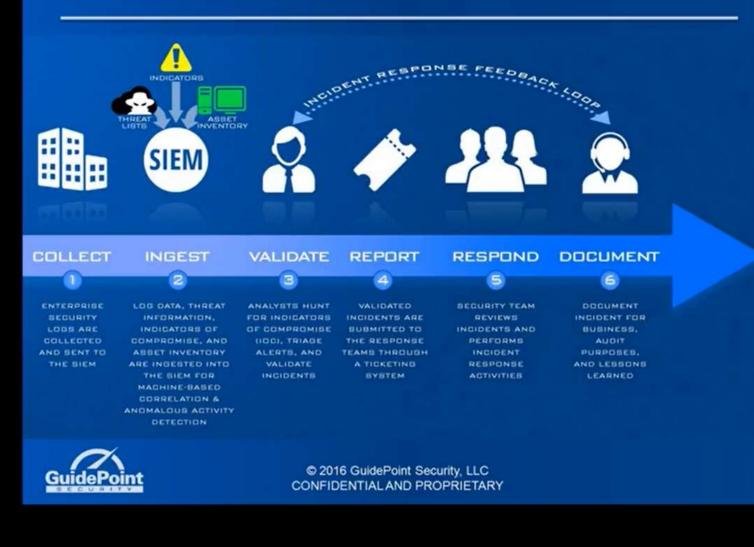

analyzed, defended, investigated, and reported.

- Networks
- Servers
- Endpoints
- Databases
- Applications
- Websites
- and other systems

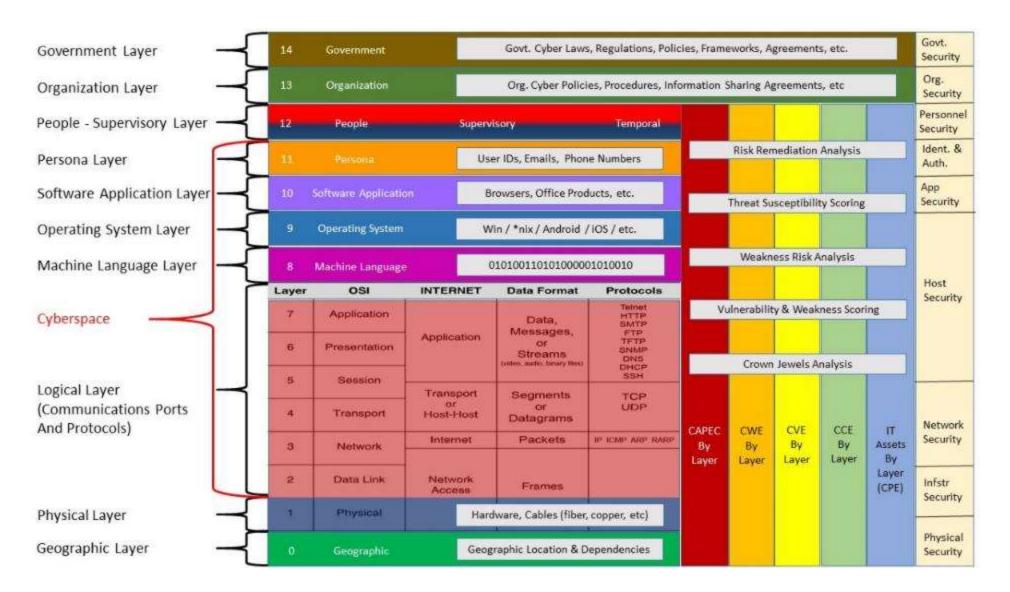

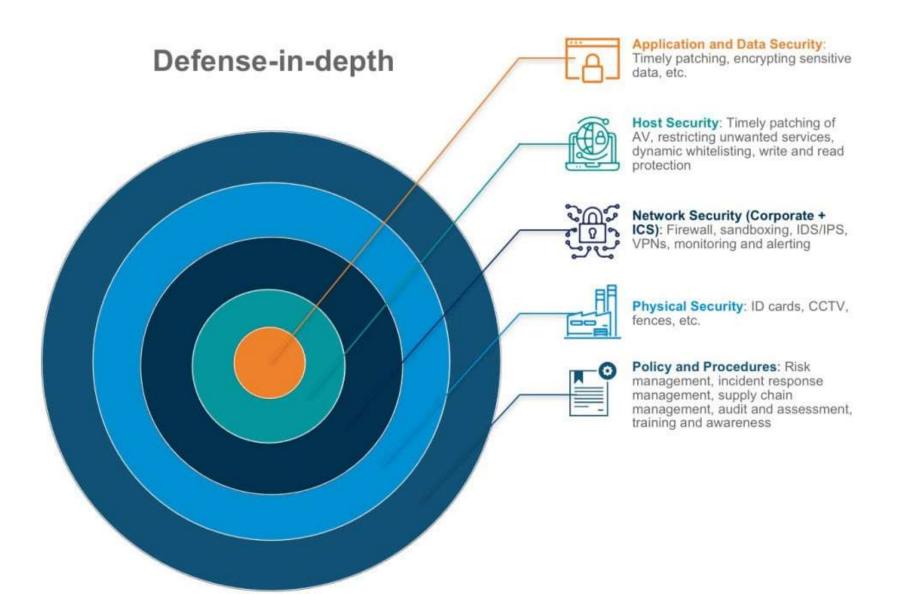

Functions of a SOC

The State of SCADA HMI Vulnerabilities

Dla firm

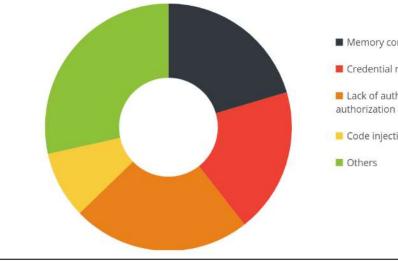

Dla domu

Dlaczego warto wybrać Trend Micro Ba Produkty Rozwiazania

Most Common HMI Vulnerability Categories

We at the Trend Micro Zero Day Initiative (ZDI) Team examined the current state of SCADA HMI security by reviewing all publicly disclosed vulnerabilities in SCADA software that have been fixed from 2015 and 2016, including 250 vulnerabilities acquired through the ZDI program.

We found that most of these vulnerabilities are in the areas of memory corruption, poor credential management, lack of authentication/authorization and insecure defaults, and code injection bugs, all of which are preventable through secure development practices.

- Memory corruption
- Credential management
- Lack of authentication/ authorization and insecure defaults
- Code injection

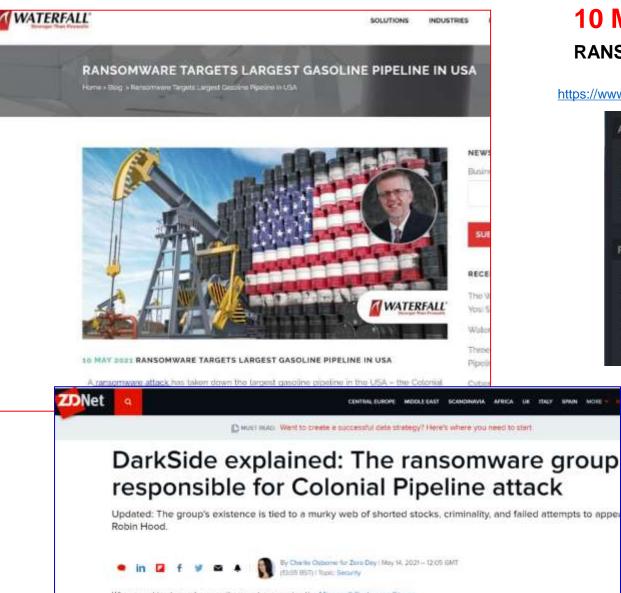

Attacking SCADA Through HMIs

SCADA systems run the world's various critical infrastructure sectors and are thus inherently attractive to different threat actors. Threat actors can use their access to SCADA systems to gather information such as a facility's layout, critical thresholds, or device settings for use in later attacks. Sabotage, including disruption of services or triggering dangerous and even lethal situations involving flammable or critical resources, represent an undesirable extreme.

14 Major SCADA Attacks and What You Can Learn From Them

https://www.dpstele.com/blog/major-scada-hacks.php

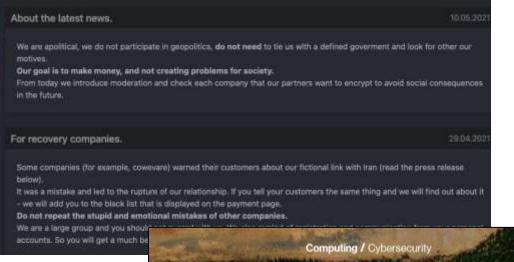

When speaking to a cybersecurity expert concerning the Microsoft Exchange Server vulnerabilities several months ago and its impact on thousands of organizations worldwide, they asked. "What could possibly be worse this year?"

AM	Access Management

CERT

Purpose:

The purpose of Knowledge and Information Management is to establish and manage an appropriate level of controls to support the confidentiality, integrity, and availability of the organization's information, vital records, and intellectual property.

KIM: Attributes of Information Assets

availability

accessible to authorized users (people, processes, or devices) whenever it is needed

confidentiality

accessible only to authorized people, processes, and devices

integrity

being in the **condition intended by the owner** and so continuing to be useful for the purposes intended by the owner

privacy

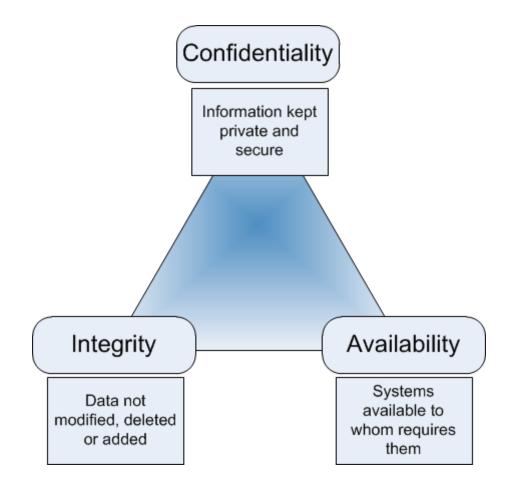

information about an individual is disclosed only to people, processes, and devices authorized by that individual or permitted under privacy laws and regulations.

sensitivity

degree to which an information asset must be protected based on the **consequences** of its unauthorized access, modification, or disclosure.

Beyond Confidentiality, Integrity & Availability

https://medium.com/@jym/beyond-confidentiality-integrity-availability-fbe4a64f69c4

KIM: Summary of Specific Goals and Practices

KIM:SG1 Establish and Prioritize Information Assets

KIM:SG1.SP1 Prioritize Information Assets

relative to their importance in supporting the delivery of high-value services

KIM:SG1.SP2 Categorize Information Assets

Examples:

SSP: develop sensitivity categorization scheme

• unclassified, typically includes

- public or non-sensitive (information that is approved for public use)

- restricted or internal use only (memos, project plans, audit reports)
- confidential or proprietary (organizational intellectual property, product designs, customer information, employee

records)

• classified, which may include levels such as

- secret

- top secret

SSP: Assign responsibility for the assignment of sensitivity categorization levels to information assets

KIM:SG2 Protect Information Assets

KIM:SG2.SP1 Assign Resilience Requirements to Information Assets

KIM:SG2.SP2 Establish and Implement Controls

KIM:SG3 Manage Information Asset Risk

KIM:SG3.SP1 Identify and Assess Information Asset Risk KIM:SG3.SP2 Mitigate Information Asset Risk

KIM: Summary of Specific Goals and Practices

KIM:SG4 Manage Information Asset Confidentiality and Privacy

KIM:SG4.SP1 Encrypt High-Value Information

Cryptographic controls are applied to information assets to ensure confidentiality and prevent accidental disclosure

Typical work products:

- 1. Policy and guidelines for encryption application
- 2. Encryption methodologies and technologies
- 3. Cryptographic key management policies and procedures
- 4. Encrypted information assets

KIM:SG4.SP2 Control Access to Information Assets

Example (compliances):

Laws and regulations concerning confidentiality and privacy include

- Family Educational Rights and Privacy Act (FERPA)
- Health Insurance Portability and Accountability Act (HIPAA)
- Gramm-Leach-Bliley Act (GLB)
- Fair Credit Reporting Act (FCRA)
- Children's Online Privacy Protection Act (COPPA)

KIM:SG4.SP3 Control Information Asset Disposition

Typical work products: Information asset disposition guidelines

KIM: Summary of Specific Goals and Practices

KIM:SG5 Manage Information Asset Integrity

KIM:SG5.SP1 Control Modification to Information Assets

Typical work products:

- 1. Information asset access control lists
- 2. List of staff members authorized to modify information assets
- 3. Information asset modification logs

4. Audit reports

KIM:SG5.SP2 Manage Information Asset Configuration

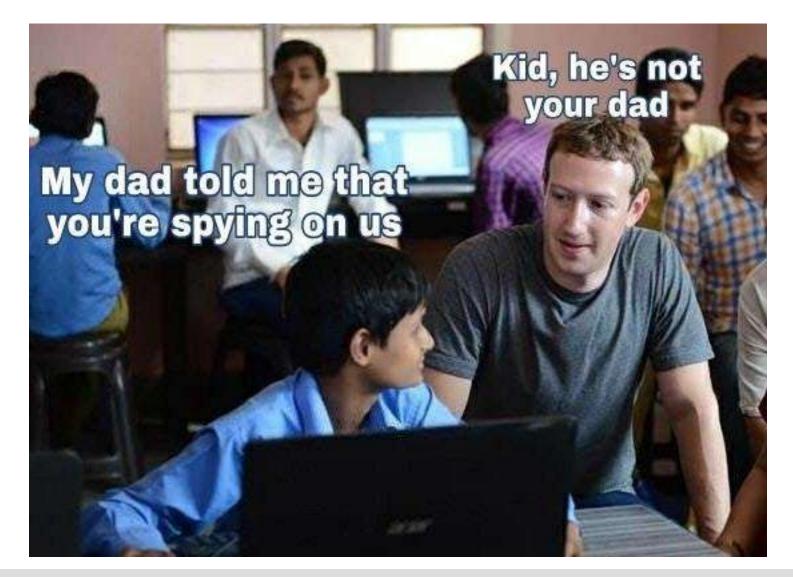

KIM:SG5.SP3 Verify Validity of Information

KIM:SG6 Manage Information Asset Availability

KIM:SG6.SP1 Perform Information Duplication and Retention

KIM:SG6.SP2 Manage Organizational Knowledge

GDPR + social networks

Purpose:

The purpose of Technology Management is to establish and manage an appropriate level of controls related to the integrity and availability of technology assets to support the resilient operations of organizational services.

TM:SG1 Establish and Prioritize Technology Assets

TM:SG1.SP1 Prioritize Technology Assets TM:SG1.SP2 Establish Resilience-Focused Technology Assets

TM:SG2 Protect Technology Assets

TM:SG2.SP1 Assign Resilience Requirements to Technology Assets TM:SG2.SP2 Establish and Implement Controls

TM:SG3 Manage Technology Asset Risk

TM:SG3.SP1 Identify and Assess Technology Asset Risk TM:SG3.SP2 Mitigate Technology Risk

TM:SG4 Manage Technology Asset Integrity

TM:SG4.SP1 Control Access to Technology Assets TM:SG4.SP2 Perform Configuration Management TM:SG4.SP3 Perform Change Control and Management TM:SG4.SP4 Perform Release Management

TM:SG5 Manage Technology Asset Availability

TM:SG5.SP1 Perform Planning to Sustain Technology Assets TM:SG5.SP2 Manage Technology Asset Maintenance TM:SG5.SP3 Manage Technology Capacity TM:SG5.SP4 Manage Technology Interoperability **Goals Practices**

ADM:SG1 Establish Organizational Assets ADM:SG1.SP1 Inventory Assets ADM:SG1.SP2 Establish a Common Understanding ADM:SG1.SP3 Establish Ownership and Custodianship

ADM:SG2 Establish the Relationship Between Assets and Services ADM:SG2.SP1 Associate Assets with Services ADM:SG2.SP2 Analyze Asset-Service Dependencies

ADM:SG3 Manage Assets

ADM:SG3.SP1 Identify Change Criteria ADM:SG3.SP2 Maintain Changes to Assets and Inventory

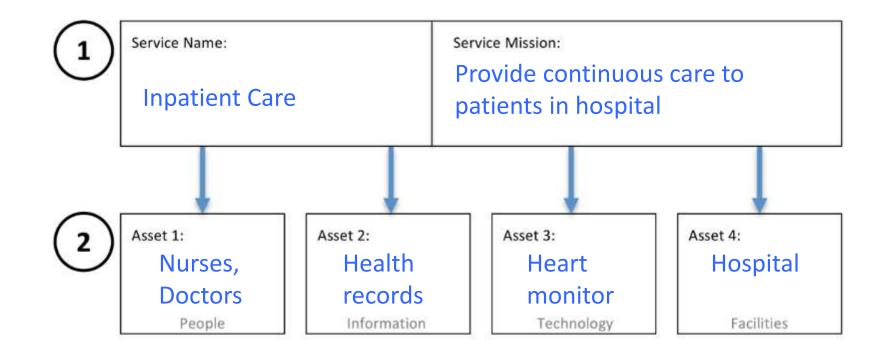

Exercise:

Assets, mission, disruption, impact

CIA sampling (& KIM basics)

Exercise part 1, steps 1 & 2

Exercise part 1, step 3

A. What is the strategic importance of the service?

As a hospital, providing continuous care to in-patients is our top strategic objective

B. Which asset could be disrupted and how?

Health records could be lost or corrupted due to record system failure

C. What would be the impact on the service mission if the asset were disrupted?

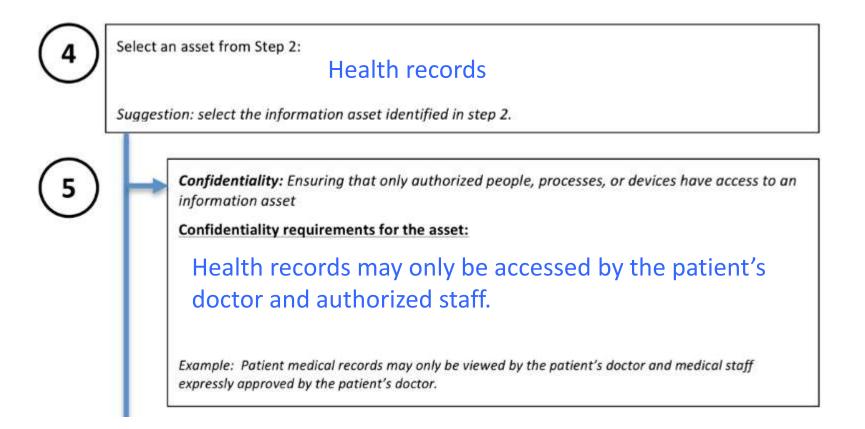

Patients might not receive appropriate or timely care

D. What consequences, if any, would the organization experience? Consider a) reputational harm, b) impacts to life, safety, and health of employees and customers, c) legal fines or penalties, and d) other financial losses.

Potential loss of life, serious reputational and financial harm

Exercise part 2, steps 4 & 5

Exercise part 2, steps 6 & 7

records, electronic IDs to access data center	automatically backup data
Physical:	Physical:
Example: lock data center and strictly limit access	Example: physically separate primary and secondary data center store backups offsite

Purpose:

The purpose of Identity Management is to create, maintain, and deactivate identities that may need some level of trusted access to organizational assets and to manage their associated attributes

ID: Identity Management

- **disclosure of information** (resulting in violations of privacy and confidentiality requirements)
- unauthorized use of systems and servers (to carry out fraudulent activities)
- unauthorized entry to secured facilities (which could affect the life, safety, and health of staff and customers)
- destruction or loss of vital information and systems that the organization relies upon day-to-day to carry out its strategic objectives

Because the operating environment is complex and the **persons**, **objects**, **and entities** that need access to organizational assets are ever-changing, the organization must actively **manage the population of identities** to ensure that it is valid.

ID: Identity Management

Goals/Practices

ID:SG1 Establish Identities

Identities are created to represent persons, objects, and entities that require access to organizational assets.

ID:SG1.SP1 Create Identities

• Persons, objects, and entities that require access to organizational assets are registered and profiled.

ID:SG1.SP2 Establish Identity Community

• identity community can be defined as the collection of the organization's identity profiles. The identity community defines the baseline population of persons, objects, and entities—internal and external to the organization

ID:SG1.SP3 Assign Roles to Identities

ID:SG2 Manage Identities

Identities are managed to ensure they reflect the current environment of associated persons, objects, and entities.
 ID:SG2.SP1 Monitor and Manage Identity Changes

ID:SG2.SP2 Periodically Review and Maintain Identities

- to identify identities that are invalid
 - ID:SG2.SP3 Correct Inconsistencies
- Inconsistencies between the identity community and the persons, objects, and entities they represent are corrected.
 ID:SG2.SP4 Deprovision Identities
- Identities for which need has expired or has been eliminated are deprovisioned

Something You Know, Have, or Are Multifactor Authentication

All approaches for human authentication rely on at least one of the following:

- Something you know (eg. a password). This is the most common kind of authentication used for humans. We use passwords every day to access our systems. Unfortunately, something that you know can become something you just forgot. And if you write it down, then other people might find it.
- Something you have (eg. a smart card). This form of human authentication removes the problem of forgetting something you know, but some object now must be with you any time you want to be authenticated. And such an object might be stolen and then becomes something the attacker has.
- Something you are (eg. a fingerprint). Base authentication on something intrinsic to the principal being authenticated. It's much harder to lose a fingerprint than a wallet. Unfortunately, biometric sensors are fairly expensive and (at present) not very accurate.

Multi-Factor Authentication

POSSESION

Access badges, Cell phones, OTPs, Laptops

KNOWLEDGE

CY RES

SOCIAL ENGINEERING

In computer science, social engineering is "the act of manipulating a person to take an action that may or may not be in the target's best interest".

Cristopher Hadnagy, "Social
 Engineering: The Art of Human
 Hacking"

IMPORTANT NOTIONS

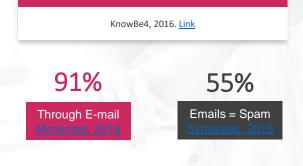

- Social engineering is "always psychological and sometimes technical"
- "The psychological aspect of social engineering is what makes the attack, not the technical"
- We will focus mostly on the technical aspect, while still acknowledging the psychological factors are leading
- It can be mitigated somewhat with technical means

\$5 billion stollen

2013-2016 worldwide through SE

PhisMe, 2017. Link

Only about 3% of malware tries to exploit an exclusively technical flaw. The other 97% instead targets users through SE.

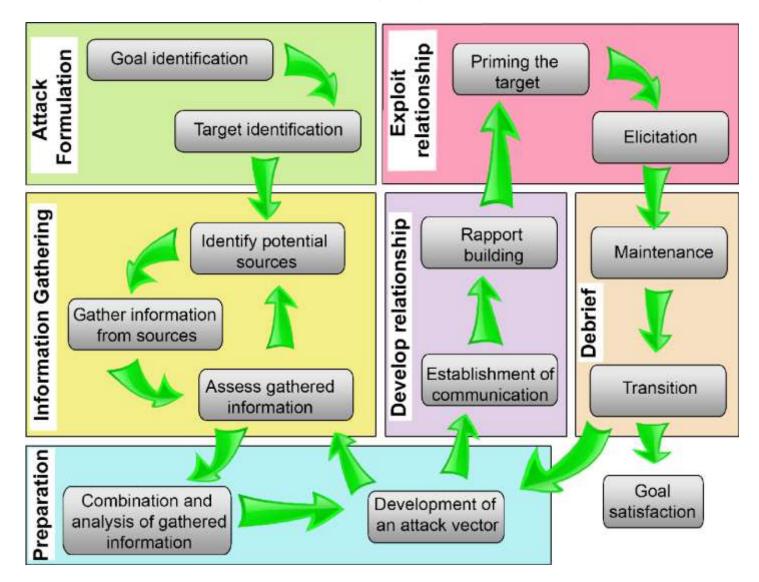

A SUCCESSFUL SOCIAL ENGINEERING ATTACK

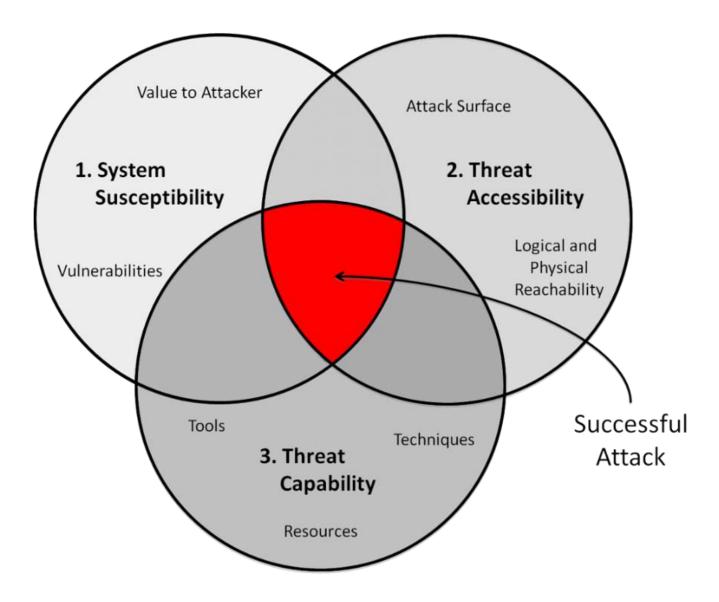

A HUMAN HAS BEEN MANIPULATED TO BYPASS AN ACCESS CONTROL RESULTING IN UNAUTHORIZED ACCESS TO INFORMATION.

Social Engineering Attack Framework

Mouton et al., (2016) Social engineering attack examples, templates and scenarios

my

AM: Access Management

In order to support services, assets such as information, technology, and facilities must be made available (accessible) for use. This requires that persons (employees and contractors), objects (such as systems), and entities (such as business partners) have sufficient (but not excessive) levels of access to these assets.

AM:SG1 Manage and Control Access

- AM:SG1.SP1 Enable Access
- AM:SG1.SP2 Manage Changes to Access Privileges
- AM:SG1.SP3 **Periodically Review** and Maintain Access Privileges
- AM:SG1.SP4 Correct Inconsistencies

VAR: VULNERABILITY ANALYSIS AND RESOLUTION Related PAs: RISK, MON, IMC

<u>Purpose</u>: The purpose of Vulnerability Analysis and Resolution is to identify, analyze, and manage vulnerabilities in an organization's operating environment.

VAR:SG1 Prepare for Vulnerability Analysis and Resolution

VAR:SG2 Identify and Analyze Vulnerabilities

VAR:SG3 Manage Exposure to Vulnerabilities

VAR:SG4 Identify Root Causes

VAR: VULNERABILITY ANALYSIS AND RESOLUTION

Samples

VAR:SG1 Prepare for Vulnerability Analysis and Resolution

VAR:SG1.SP1 Establish Scope

The assets and operational environments that must be examined for vulnerabilities are identified

An asset and the services are vulnerable to disruption if there is a weakness that is not currently **remediated by an administrative, technical, or physical control.** The universe of potential vulnerabilities in an organization's operational environment is almost limitless. The organization must therefore focus its vulnerability analysis and resolution activities toward **identifying the vulnerabilities to the organization's most high-value assets and services.** Otherwise, the organization can expend significant human and financial resources identifying vulnerabilities that have limited potential for posing operational risk to the organization.

VAR:SG1.SP2 Establish a Vulnerability Analysis and Resolution Strategy

- A comprehensive vulnerability management strategy addresses items such as
- the determination and documentation of the scope of vulnerability analysis and resolution
- a plan for performing vulnerability analysis and resolution
- resources and accountability for vulnerability identification and remediation
- approved methods and tools to be used for the identification, analysis, remediation, monitoring, and communication of vulnerabilities
- a process for organizing, categorizing, comparing, and consolidating vulnerabilities
- thresholds for remediation and resolution activities
- time intervals for vulnerability identification and monitoring activities

VAR:SG2 Identify and Analyze Vulnerabilities VAR:SG2.SP1 Identify Sources of Vulnerability Information

These are examples of sources of vulnerability data:

• vendors of software, systems, and hardware technologies that provide warnings on vulnerabilities in their products

• common free catalogs, such as the US-CERT Vulnerability Notes Database and the MITRE Corporation's Common Vulnerabilities and Exposures list

- industry groups
- vulnerability newsgroups and mailing lists
- the results of executing automated tools, techniques, and methods
- internal processes such as service desk, problem management, incident management and control, and monitoring, where vulnerabilities may be detected

VAR:SG2.SP2 Discover Vulnerabilities

A process is established to actively discover vulnerabilities. These include:

- performing internal vulnerability audits or assessments (using tools, techniques, and methods)
- performing external-entity assessments
- reviewing the results of internal and external audits
- periodically reviewing vulnerability catalogs, such as the US-CERT Vulnerability Notes Database and the MITRE Corporation's Common Vulnerabilities and Exposures list
- subscribing to vendor notification services
- subscribing to vulnerability notification services (mailing lists)
- reviewing reports from industry groups
- reviewing vulnerability newsgroups
- using lessons-learned databases, such as the incident knowledgebase (The incident knowledgebase is addressed in the Incident Management and Control process area.)
- monitoring high-value organizational processes and infrastructure (Monitoring for events, incidents, and vulnerabilities is addressed in the Monitoring process area.)
- using reports of vulnerabilities from other processes such as the organization's service desk or the problem management process

Референтен стандарт за уеб услуги

ниво 2 може да се счита за "нормално"

OWASP Top Ten

Main Translation_Efforts Sponsors Data_2020

The OWASP Top 10 is a standard awareness document for developers and web application security. It represents a broad consensus about the most critical security risks to web applications.

Globally recognized by developers as the first step towards more secure coding.

Companies should adopt this document and start the process of ensuring that their web applications minimize these risks. Using the OWASP Top 10 is perhaps the most effective first step towards changing the software development culture within your organization into one that produces more secure code.

Top 10 Web Application Security Risks

- Injection. Injection flaws, such as SQL, NoSQL, OS, and LDAP injection, occur when untrusted data is sent to an interpreter as part of a command or query. The attacker's hostile data can trick the interpreter into executing unintended commands or accessing data without proper authorization.
- Broken Authentication. Application functions related to authentication and session management are often implemented incorrectly, allowing attackers to compromise passwords, keys, or session tokens, or to exploit other implementation flaws to assume other users' identities temporarily or permanently.
- 3. Sensitive Data Exposure. Many web applications and APIs do not properly protect sensitive data, such as financial, healthcare, and PII. Attackers may steal or modify such weakly protected data to conduct credit card fraud, identity theft, or other crimes. Sensitive data may be compromised without extra protection, such as encryption at rest or in transit, and requires special precautions when exchanged with the browser.
- 4. XML External Entities (XXE). Many older or poorly configured XML processors evaluate external entity references within XML documents. External entities can be used to disclose internal files using the file URI handler, internal file shares, internal port scanning, remote code execution, and denial of service attacks.
- Broken Access Control. Restrictions on what authenticated users are allowed to do are often not properly
 enforced. Attackers can exploit these flaws to access unauthorized functionality and/or data, such as access
 other users' accounts, view sensitive flies, modify other users' data, change access rights, etc.
- 6. Security Misconfiguration, Security misconfiguration is the most commonly seen issue. This is commonly a result of insecure default configurations, incomplete or ad hoc configurations, open cloud storage, misconfigured HTTP headers, and verbose error messages containing sensitive information. Not only must all operating systems, frameworks, libraries, and applications be securely configured, but they must be patched/upgraded in a timely fashion.
- 7. Cross-Site Scripting XSS. XSS flaws occur whenever an application includes untrusted data in a new web

OWASP Application Security Verification Standard (ASVS) Project

Security Verification Requirements

#	Description	L1	L2	L3	Since
1.1	All app components are identified and known to be needed.	\checkmark	\checkmark	\checkmark	1.0
1.2	Security controls are never enforced only on the client side, but on the respective remote endpoints.		\checkmark	\checkmark	1.0
1.3	A high-level architecture for the application and all connected remote services has been defined and security has been addressed in that architecture.		~	~	1.0
1.4	Data considered sensitive in the context of the application is clearly identified.			\checkmark	1.0
1.5	All app components are defined in terms of the business functions and/or security functions they provide.			\checkmark	1.0
1.6	A threat model for the application and the associated remote services has been produced that identifies potential threats and countermeasures.			~	1.0
1.7	All security controls have a centralized implementation.		\checkmark	\checkmark	3.0
1.8	Components are segregated from each other via a defined security control, such as network segmentation, firewall rules, or cloud based security groups.		~	~	3.0
1.9	A mechanism for enforcing updates of the application exists.		\checkmark	\checkmark	3.0
1.10	Security is addressed within all parts of the software development lifecycle.		\checkmark	\checkmark	3.0
1.11	all application components, libraries, modules, frameworks, platform, and operating systems are free from known vulnerabilities		~	~	3.0.1
1.12	There is an explicit policy for how cryptographic keys (if any) are managed, and the lifecycle of cryptographic keys is enforced. Ideally, follow a key management standard such as NIST SP 800-57.		~	~	3.1

Name	Description
CVE-2020-0978	A cross-site-scripting (XSS) vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft Office SharePoint XSS Vulnerability'. This CVE ID is unique from CVE-2020-0923, CVE-2020-0924, CVE-2020-0925, CVE 2020-0926, CVE-2020-0927, CVE-2020-0930, CVE-2020-0933, CVE-2020-0954, CVE-2020-0973.
CVE-2020-0977	A spoofing vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft SharePoint Spoofing Vulnerability'. This CVE ID is unique from CVE-2020-0972, CVE-2020-0975, CVE-2020-0976.
CVE-2020-0976	A spoofing vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft SharePoint Spoofing Vulnerability'. This CVE ID is unique from CVE-2020-0972, CVE-2020-0975, CVE-2020-0977.
CVE-2020-0975	A spoofing vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft SharePoint Spoofing Vulnerability'. This CVE ID is unique from CVE-2020-0972, CVE-2020-0976, CVE-2020-0977.
CVE-2020-0974	A remote code execution vulnerability exists in Microsoft SharePoint when the software fails to check the source markup of an application package, aka 'Microsoft SharePoint Remote Code Execution Vulnerability'. This CVE ID is unique from CVE-2020-0920, CVE-2020-0929, CVE-2020-0931, CVE-2020- 0932, CVE-2020-0971.
CVE-2020-0973	A cross-site-scripting (XSS) vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft Office SharePoint XSS Vulnerability'. This CVE ID is unique from CVE-2020-0923, CVE-2020-0924, CVE-2020-0925, CVE 2020-0926, CVE-2020-0927, CVE-2020-0930, CVE-2020-0933, CVE-2020-0954, CVE-2020-0978.
CVE-2020-0972	A spoofing vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft SharePoint Spoofing Vulnerability'. This CVE ID is unique from CVE-2020-0975, CVE-2020-0976, CVE-2020-0977.
CVE-2020-0971	A remote code execution vulnerability exists in Microsoft SharePoint when the software fails to check the source markup of an application package, aka 'Microsoft SharePoint Remote Code Execution Vulnerability'. This CVE ID is unique from CVE-2020-0920, CVE-2020-0929, CVE-2020-0931, CVE-2020- 0932, CVE-2020-0974.
CVE-2020-0954	A cross-site-scripting (XSS) vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft Office SharePoint XSS Vulnerability'. This CVE ID is unique from CVE-2020-0923, CVE-2020-0924, CVE-2020-0925, CVE 2020-0926, CVE-2020-0927, CVE-2020-0930, CVE-2020-0933, CVE-2020-0973, CVE-2020-0978.
CVE-2020-0933	A cross-site-scripting (XSS) vulnerability exists when Microsoft SharePoint Server does not properly sanitize a specially crafted web request to an affected SharePoint server, aka 'Microsoft Office SharePoint XSS Vulnerability'. This CVE ID is unique from CVE-2020-0923, CVE-2020-0924, CVE-2020-0925, CVE 2020-0926, CVE-2020-0927, CVE-2020-0930, CVE-2020-0954, CVE-2020-0973, CVE-2020-0978.
CVE-2020-0932	A remote code execution vulnerability exists in Microsoft SharePoint when the software fails to check the source markup of an application package, aka 'Microsoft SharePoint Remote Code Execution Vulnerability'. This CVE ID is unique from CVE-2020-0920, CVE-2020-0929, CVE-2020-0931, CVE-2020- 0971, CVE-2020-0974.
CVE-2020-0931	A remote code execution vulnerability exists in Microsoft SharePoint when the software fails to check the source markup of an application package, aka 'Microsoft SharePoint Remote Code Execution Vulnerability'. This CVE ID is unique from CVE-2020-0920, CVE-2020-0929, CVE-2020-0932, CVE-2020-

VAR: VULNERABILITY ANALYSIS AND RESOLUTION Samples

VAR:SG2.SP3 Analyze Vulnerabilities

Vulnerabilities are analyzed to determine whether they have to be reduced or eliminated.

Subpractices...: Prioritize and categorize vulnerabilities for disposition

- Examples of categories for vulnerability resolution:
- Take no action; ignore.
- Fix immediately (typically the case for vendor updates or changes).
- Develop and implement vulnerability resolution strategy (typically the case when the resolution is more extensive than simple actions such as vendor updates).
- Perform additional research and analysis.
- Refer the vulnerability to the risk management process for formal risk consideration.

Menacing Malware Shows the Dangers of Industrial System Sabotage

New details about Triton malware should put industrial systems and critical infrastructure on notice.

It's still unknown exectly what industrial plant Triton malware struck, or where. But new details show just how dengerous its brand of satiotage could be: 20#A2HUAN6/SETTY THACES

A RECENT DIGITAL attack on the control systems of an industrial plant has renewed concerns about the threat hacking poses to critical infrastructure. And while security researchers offered some analysis last month of the malware used in the attack, called Triton or Trisis, newly revealed details of how it works expose just how vulnerable industrial plants-and their failsafe mechanisms-could be to manipulation.

At the S4 security conference on Thursday, researchers from the industrial control company Schneider Electric, whose

Triton/Trisis Attack Was More Widespread Than Publicly Known

Signs of the attack first showed up two months before it was identified as a cyberattack, but they were mistaken for a pure equipment failure by Schneider Electric, security expert reveals at S4x19.

[UPDATED 1/16/2019 7:40PM with updated new comments from Schneider Electric]

S4x19 -- Miami -- New details have emerged about the 2017 Triton/Trisis cyberattack on a Middle East plant's safety instrumentation system -- including a missed opportunity to quash it two months earlier than its ultimate discovery, according to an ICS security expert who assisted in the incident response.

New information also shows that the attackers infected six engineering systems, not just two as investigators had reported, said Julian Gutmanis, who was working out of a major oil and gas organization in Saudi Arabia at the time of the attacks, in a presentation here at S4. The publicly revealed attack on Aug. 7, 2017, was not the first incident suffered by the victim at the hands of the Triton/Trisis attackers, he said. In June 2017, an emergency plant-process shutdown

ERABILITIES / THREATS

Schneider Electric: TRITON/TRISIS Atta Used 0-Day Flaw in Safety Controller System, and a RAT

ICS/SCADA vendor discloses in-depth of a recent targeted attack against one customers.

[UPDATED 12:50pmET with information Schneider's customer advisory issued to

S4x18 CONFERENCE – Miami – Industr systems giant Schneider Electric discove day privilege-escalation vulnerability in its Tricon safety-controller firmware which h sophisticated hackers to wrest control of emergency shutdown system in a targete one of its customers.

Researchers at Schneider also found a r access Trojan (RAT) in the so-called TRITON/TRISIS malware that they say re the first-ever RAT to infect safety-instrum systems (SIS) equipment. Industrial sites and gas and water utilities typically run m SISes to independently monitor critical sy ensure they are operating within accepta thresholds, and when they are not, the S automatically shuts them down.

Schneider here today provided the first d investigation of the <u>recently revealed</u> TRITON/TRISIS attack that targeted a sp

Vulnerability Metrics

The Common Vulnerability Scoring System (CVSS) is an open framework for communicating the characteristics and severity of software vulnerabilities. CVSS

consists of three metric groups: Base, Temporal, and Environmental. The Base metrics produce a score ranging from 0 to 10, which can then be modified by scoring the Temporal and Environmental metrics. A CVSS score is also represented as a vector string, a compressed textual representation of the values used to derive the score. Thus, CVSS is well suited as a standard measurement system for industries, organizations, and governments that need accurate and consistent vulnerability severity scores. Two common uses of CVSS are calculating the severity of vulnerabilities discovered on one's systems and as a factor in prioritization of vulnerability remediation activities. The National Vulnerability Database (NVD) provides CVSS scores for almost all known vulnerabilities.

The NVD supports both Common Vulnerability Scoring System (CVSS) v2.0 and v3.X standards. The NVD provides CVSS 'base scores' which represent the inpate characteristics of each vulnerability. The NVD does not currently provide

CVSS v3.1 Equations

The CVSS v3.1 equations are defined below.

Base

The Base Score is a function of the Impact and Exploitability sub score equations. Where the Base score is .defined as,

If (Impact sub score ≤ 0)	0 else,
Scope Unchanged ₄	Roundup(Minimum[(Impact + Exploitability), 10])
Scope Changed	$Roundup(Minimum[1.08 \times (Impact + Exploitability), 10])$
and the Impact sub score (ISC)	is defined as,
Scope Unchanged 6.42 \times IS	SC_{Base}
Scope Changed 7.52 \times [ISC	$C_{Base} = 0.029] = 3.25 \times [ISC_{Base} = 0.02]^{15}$
Where,	
$ISC_{Base} = 1 - [(1 - Impact_{Col})]$	$_{onf}$) × $(1 - Impact_{Integ})$ × $(1 - Impact_{Avail})$]
And the Exploitability sub score	

 $8.22 \times AttackVector \times AttackComplexity \times PrivilegeRequired \times UserInteractionTemporal$

The Temporal score is defined as,

Roundup(*BaseScore* × *ExploitCodeMaturity* × *RemediationLevel* × *ReportConfidence*)

Environmental

The environmental score is defined as,

If (Modified Impact Sub score ≤ 0) 0 else,

If Modified Scope is Unchanged Round up (Round up (Minimum [(M.Impact + M.Exploitability) ,10]) × Exploit Code Maturity × Remediation Level × Report Confidence)

If Modified Scope is ChangedRound up(Round up (Minimum [1.08 × (M.Impact +M.Exploitability) ,10]) × Exploit Code Maturity × Remediation Level × Report Confidence)

And the modified Impact sub score is defined as,

If Modified Scope is Unchanged 6.42 \times [*ISC*_{Modified}]

If Modified Scope is Changed 7.52 × $[ISC_{Modified} - 0.029]$ -3.25 × $[ISC_{Modified} \times 0.9731 - 0.02]$ 13

Where,

 $ISC_{Modified} = Minimum [[1 - (1 - M. IConf \times CR) \times (1 - M. IInteg \times IR) \times (1 - M. IAvail \times AR)], 0.915]$

The Modified Exploitability sub score is,

 $8.22 \times M$. AttackVector $\times M$. AttackComplexity $\times M$. PrivilegeRequired $\times M$. UserInteraction4 Where "Round up" is defined as the smallest number, specified to one decimal place, that is equal to or higher than its input. For example, Round up (4.02) is 4.1; and Round up (4.00) is 4.0. **219**

How the assess the (potential) impact / damage in unified way (based on unified taxonomy)?

Example of severity of impact scoring system in a multi-state model (MS ISAC, USA)

https://www.cisecurity.org/cybersecurity-threats/alert-level/

How Levels are Determined – using multi-state model (SEE THE LINK FOR DETAILS):

The Alert Level is determined using the following threat severity formula:

Severity = (Criticality + Lethality) - (System Countermeasures + Network Countermeasures)

- Lethality: How likely is it that the attack will do damage? (Value = Potential Damage)
 - 5: Exploit exists. Attacker could gain root or administrator privileges. Attacker could commit denial of service.
 - *4: Exploit exists. Attacker could gain user level access privileges. Attacker could commit denial of service.*
 - *3:* No known exploit exists. Attacker could gain root or administrator privileges. Attacker could commit degradation of service.
 - 2: No known exploit exists. Attacker could gain user level access privileges.
 - o 1: No known exploit exists. Attacker could not gain access.
- Criticality: What is the target of the attack? (Value = Target)
- System Countermeasures: What host-based preventive measures are in place? (Value = Countermeasure)
- Network Countermeasures: What network-based preventive measures are in place? (Value = Countermeasure)

Using the result from the formula defined above, the Alert Level Indicator would generally reflect severity levels as follows: Alert Level Indicator - Severity

- Green Low : -8 to -5
- Blue Guarded : -4 to -2
- Yellow Elevated : -1 to +2
- Orange High : +3 to +5
- Red Severe : +6 to +8

Assessments: Cyber Resilience Review (CRR)

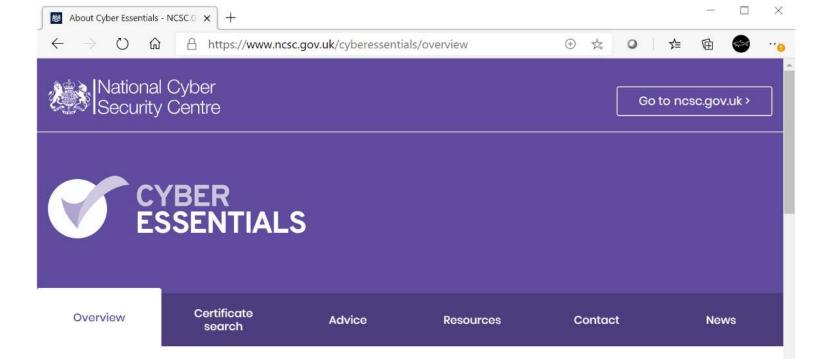

The Department of Homeland Security (DHS) partnered with the Computer Emergency Response Team (CERT) Division of Carnegie Mellon University's Software Engineering Institute to create the CRR. The CRR is a derivative of the CERT Resilience Management Model (RMM) (<u>http://cert.org/resilience/rmm.html</u>) tailored to the needs of critical infrastructure owners and operators.

CIP

Critical infrastructure protection (CIP) is a concept that relates to the preparedness and response to serious incidents that involve the critical infrastructure of a region or nation. *Critical infrastructure* (or critical national infrastructure is a term used by governments to describe assets that are essential for the functioning of a society and economy – the infrastructure.

The systems and networks that make up the infrastructure of society are often taken for granted, yet a disruption to just one of those systems can have dire consequences across other sectors.

Christina Todorova

The process includes assessments of:

- **Protection** Can be defined as the state of being defended, safeguarded, or shielded from injury, loss, or destruction from natural or unnatural forces.
- **Vulnerability** The quality of being susceptible to attack or injury, warranted or unwarranted, by accident or by design.
- **Risk** The possibility or likelihood of being attacked or injured.
- Mitigation The ability to alleviate, reduce, or moderate a vulnerability, thus reducing or eliminating risk.

DESIGN

Plans and policies for response, mitigation and reconstitution to

DEVELOP

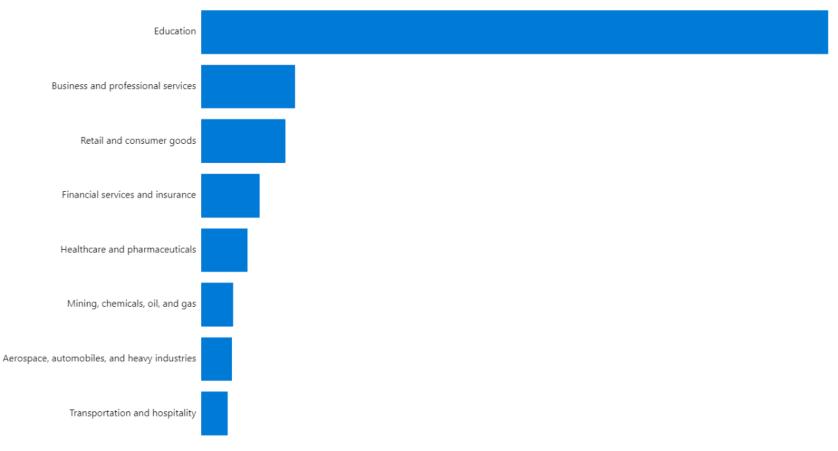

Develop systems to identify and prevent attempted attacks

ALERT

Alert, contain and rebuff attacks and rebuild essential capabilities in the aftermath

CIP Lifecycle

An important "tiny" amendment to the Cyber Act: <u>The Blueprint</u> EU CYBRID: Cyber crisis = Hybrid crisis

Recommendation (EU) 2017/1584 on Coordinated Response to Large Scale Cybersecurity Incidents and Crises:

- importance for Member States to have a mechanism in place that would allow for an effective handling and response to cybersecurity incidents of a large-scale and crises.
- how to incorporate cyber security in existing crisis management mechanisms
- Fundamental for the cooperation and collaboration mechanisms to handle incident of a large scale (multi countries/sectors/players) – automation in info exchange, but also in incident response

• Recommendation Nr. 7

Member States, with the assistance of ENISA and building on previous work in this area, should cooperate in developing and adopting a common taxonomy and template for situational reports to describe the technical causes and impacts of cybersecurity incidents to further enhance their technical and operational cooperation during crises. In this regard, Member States should take into account the ongoing work within the Cooperation Group on incident notification guidelines and in particular aspects related to the format of national notifications

Recital 20 (on Situational awareness)

Awareness and understanding of the real-time situation, risk posture, and threats gained through reporting, assessments, research, investigation, and analysis, is vital to enable well-informed decisions This 'situational awareness' - by all relevant stakeholders - is essential for an effective coordinated response. Situational awareness includes elements about the causes as well as the impact and origin of the incident.

Update on cybersecurity standards and certifications (EU/EC)
